Thread: [WebBrowser \[HELP\]](#)

Qustom - February 17, 2012, 5:29 am

I once did some webbrowser (standard) tests in Visual Basic 2008 Express and i didn't use it to more than fun.

Now I've been working on something basically the same but with a twist. There's an online game that i want to put into my program. Make it a desktop-version so to speak.

So here's the deal:

I've used iframe to a specific part of the site* to get 2 things:

1. the game window
2. the login window

www.unikkunst.com/index.html

www.unikkunst.com/login.html

Both of those sites i use in my program. I used a template to a simple webbrowser and then modified it a bit to default go to one of those sites.

But the thing is that when i log to www.unikkunst.com/login.html and i refresh [unikkunst.com/index.html](http://www.unikkunst.com/index.html) i get it to work. I use Google Chrome. It's like Chrome "knows" that i already logged in, in the other page.

But in my simple webbrowser it doesn't. I simply can't "tell" it that I AM logged in already.

What sort of code do i need to add so it remembers the other form (i created 2 forms) in Visual Basic 2008?

If somebody could help me out here i would be REALLY glad!
Thanks in advance :-)

I tried to sniff the post data but couldn't, you're going to have to look at the javascript and see what you can do off that.

Go off this website: "http://www.tanktrouble.com/"

The website you're using is an iframe which is pretty stupid, just use the original.

dbRenaud - February 18, 2012, 3:49 pm

Gotta say I Agreed with MoBaT ...! :)

Well i made that iframe from that page tanktrouble.com
I mean its the whole thing about it.

In that way i only get the selected part of the page in my Webform in visual basic. I don't want the
add's ect :-)

MoBaT - February 18, 2012, 5:32 pm

Login using HTTPWEBREQ which wont be hard, transfer the cookies to the webbrowser then load
the game page.

Qustom - February 18, 2012, 6:16 pm

Sounds about it.

How do i do that? Could you elaborate please?
