Thread: [\[TuT\]How to set up Siri on non-4S iDevices 100% WORKING-- \[N00B FRIENDLY\]](#)

m4mb0 - March 8, 2012, 6:50 pm

Well I Saw that people are looking so much how to manage to get Siri on non-4S iDevices like iPhone 4 iPad 1 ore iPhone 3 GS, I found a way how to solve this problem and I thought to make an tutorial about this "problem".

All you need to have is a non-4s iDevice (iPhone 4, iPad 1 ore iPhone 3GS) Jailbraked with iOS 5.0.1 .(Tutorials about How can u Jailbrake iDevice with iOS 5.0.1 u can find them on Google ore Youtube explained step by step) and Cydia installed on ur iDevice. So here we get started.

Step 1) : open Cydia and in the search box type "Spire" and hit search.. It will pop up like this :
Spoiler [\(Click to View\)](#)

Step 2) hit install and wait untile Cydia finishes the Installation

Note for this step U need Wifi connection and the file is arround 100 MB

After completing step 1 and 2 and installing the Spire app u need to reboot the device.

Now got Settings->Spire and u will se something like this:

Spoiler [\(Click to View\)](#)

Now here is something that I can't help u and u need to figure it out by ur own.

U see the Proxy host,there is where u need to set up ur Proxy host with Apple..

Somone will maybe ask why is this like that? Well Apple has made unposible to get siri free so with the help of this app u can get Siri free but not 100%. So u need a 4S device to get theyr Proxy host so that ur iDevice can connect to Siris servers,so if u have a friend that has a 4S device u ask him to give u the Proxy-es that will manage to connect into the Siri servers.

So that will be it feel free to PM me for any thing ore conntact me through mail
