Thread: [Registration script that creates many tables?](#)

English_Fire - March 8, 2012, 11:07 pm

EDIT: I have solved the original problem, I had a logical error that I didn't notice.

NEW QUESTION:

How can I reset the auto increment on my primary key?

If I have 10 records, and delete them all, and then enter a new record, the id will be 11.... how can I make this AI index reset without deleting everything?

You can alter the auto_increment value by the following:

Code ALTER TABLE table_name AUTO_INCREMENT = new_value

Truncate your MySQL table. It should reset the auto incrementing fields!

Okay, cool. So what would I put for the value...just 1? and then every after would follow accordingly?

I shall look this up, thanks.
