Thread: [cybergate, ports open but server wont work,What could the problem be? thanks](#)

simpson7647 - January 15, 2010, 4:52 am

hi all i have set up the ports on my router and modem to allow port 12345 for cybergate and the ports are open.

But i create a cybergate server and try to deploy on myself and nothing happens :S

Ive filled in the info on the DNS (or whatever it is) and followed tutorials :S

Its worked previously on my other computer but no luck on this one, the ports are open so that isnt the problem.

Suggestions, what the problem could be???

thanks all :)

iDecrypt - January 15, 2010, 4:53 am

Firewall, make an exception or just turn it off.

Shinoda - January 15, 2010, 5:47 am

And if it isn't the firewall, look if you filled in the correct password

stylo_asif - January 15, 2010, 7:20 am

try To Use Low port Like 1020 or 2030 Like that You Can Use 4 Figure Port

After You see Your Port Is Open Or Close This Site will Help you <http://www.canyouseeme.org>

If Your Port Is Open Then See The Port Password Must Be Same Default Password is cybergate
See If the Same Then Save And Try Again With the Crypter ... I hope It will Help You So much

simpson7647 - January 15, 2010, 10:04 am

hi all, thanks for your help

All Firewall on computer turned off

shinoda, ill make sure :)

stylo, ive used this port before 12345, so gona try and keep with it if possible, if all else fails ill change to a lower port but thanks for your help :) And my port is OPEN

And what passwords have to be the same??

Teh, what do you mean by "ALWAYS keep your No-IP DUC OPEN. Im SURE this is the reason"
" Do you just mean have it open and minimise to tray? Thanks for your help :)

Many manyyy thanks all :)

simpson7647 - January 15, 2010, 12:49 pm

bump

hi there, thanks for your reply.

Yea i will make them fud but i want to make sure it works first which i cant do atm as i cant get it to work.

Once i know it works, ill be making it fud.
thanks

r00tkiller - January 17, 2010, 1:50 pm

i think problem is they didnt opened it lol...maybe u try to upload ur cybergate on pic :P like prev tutorials or ?

explain what u trying to do and what u get...

JokersLight™ - January 17, 2010, 1:58 pm

Download Sandboxie and create a server And Go To The AntiDebug Tab And Uncheck Anti SandBoxie Then Run It In SandBoxie And See If It Works ALso Make Sure Your Server Is Setup TO Connect To You By Clicking Add Under Connection And Leaving 127.0.0.1(Testing It On Yourself) And Were 1 Is By Default Put In The Port You Want It To Connect To Hope It Helps

Zetron - January 17, 2010, 2:12 pm

I have like 200 downloads on my torrent RAT. I only have 50 connections. So not every RAT works. Sometimes it gets stuck in their firewall and sometimes they just don't open it

simpson7647 - January 17, 2010, 2:48 pm

many thanks all, ive found it out it wont work on myself although it did before which is wierd. I had a friend test it in their sandboxie and its all good so thanks all for your help :)

Rimsi - January 17, 2010, 2:51 pm

What was the problem, sim?

simpson7647 - January 18, 2010, 2:50 am

that was the problem mate

cheers

capgrased - May 26, 2011, 11:18 pm

im having the same problems. canyouseeme confirms my port is open and working. i run the server file and it runs for a few seconds then goes away. it never shows up in the cybergate window that it got connected.

Hi, can you help me..? :)

TrueSemperFi14 - June 13, 2011, 4:59 pm

yeah im having same problem when trying to test it on myself i click on the server to open it and nothing happens i think even though avg resident shield is off it still somehow blocks it maybe if i make it fud it will work

p4stt0lumb1 - July 15, 2011, 10:55 am

i can infect my self using the 127.0.0.1 server but with the no-ip server for some reason i cant. I tried infecting my other computer i had with both and none of them worked can someone help me?

Golliath808 - July 20, 2011, 7:22 am

1st,Capgrased, don't old threads,this one is 1 year old

(Jun 3, 2011 03:22 AM)Laukinuke Wrote: [\[CITE\]](#) Hi, can you help me..? :)

Do you know why you have 200downloads and only 50 connection??

There are 3 possiblities:

- their fuking firewall(just inject in defbrowser and you spoof them)
- the rat's stability,ofcourse
- and the last but not the least,
- THE BEHAVIOUR DETECTION from the AV's

sam2011hacker - January 9, 2012, 10:27 pm

setup both servers

127.0.0.1:12345

example.no-ip.biz:12345

Turtle™ - July 13, 2012, 10:53 pm

If you are testing it on yourself use the IP 127.0.0.1:12345
for anyone else, use your other IP or whatever

fyankees - July 27, 2012, 1:45 am

I have the same problem. Actually, it's other way around. It works on my VM just fine, but when I test on my friends' computers, I get no connections at all. Passwords match, AV&Firewall disabled, Port is open. I'm using Apple Airport Extreme router and it has its own firewall that blocks all unsolicited incoming connections. Could this be the problem? Any help would be great. Thanks!

hackpod94 - July 28, 2012, 3:14 pm

for a server to work it requires
you ipv4 adresse

camdenk1234 - July 30, 2012, 4:43 am

Try turning off you're firewall. Hope it helped

-Cam

HereNow - September 9, 2012, 7:44 am

This is the same problem I am trying to fix.
