Thread: [how do you host a RSPS on a linux vps?](#)

DashPHP - April 10, 2012, 8:27 am

Hey there,

I have a Linux VPS CenotOS 32b OS and I would like to know how to host my RSPS (Runescape Private Server) on the Linux? I know it's possible I just can't find the tut, so if anyone can help me I'd really appreciate that!

ps- If you don't know what rsps then dw, you can leave this thread :)

Ok, the first thing you need to do is download Java. And just compile the .Java files. And excute them. Just ignore the .Bat files.

DashPHP - April 10, 2012, 9:02 am

Hey, I forgot to mention that I'm completely new to Linux and to me it's just like a CMD, how would I download Java? and how would I upload the source files ECT?

thanks again!

Valour - April 10, 2012, 9:30 am

Download it from java.com.. And to compile it (if its not an executable) by extracting it and going to the directory through the terminal

then type

Code sudo ./configure

sudo make

sudo make installThough it should be in the repositories and you can usually get it by doing yum install java or something like that but I am not aware of Centos repos..

DashPHP - April 10, 2012, 10:38 am

I simply typed "yum install java" and it worked but how do i upload my source?

Thelcyene - April 10, 2012, 11:15 am

you could just use wget..

ex: wget www.website.com/files/rsps/stuff
