Susp3cT - April 15, 2012, 2:06 pm

Hello guys,

When I pop up this code I have just written,
I get some syntax with numbers in the front of my text! - why is that. :(...

I can't figure that out. I was wondering if it has some to do with my FORM input's ??
Hope you guys can help me out ? Thanks! ?

```
Code <!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Strict//EN"
      "http://www.w3.org/TR/xhtml1/DTD/xhtml1-strict.dtd">
<html xmlns="http://www.w3.org/1999/xhtml">
<title>Susp3cT Testing ZONE!</title>
  <meta http-equiv="content-type"
        content="text/html; charset=utf-8" />
</head>
<SCRIPT language=JavaScript>
  var message = "Copyright - Susp3cT";
  function rtclickcheck(keyp){ if (navigator.appName == "Netscape" && keyp.which == 3){
alert(message); return false; }
  if (navigator.appVersion.indexOf("MSIE") != -1 && event.button == 2) {   alert(message);
return false; } }
  document.onmousedown = rtclickcheck;
</SCRIPT>

<body [b]onload=[/b]"type_text()" ; bgColor=black text=#4d5e49><center>
<div align="center">
<div style="width: 900px; height: 100px;" align="center">

<form method="POST" action="news.php">
<input type="text" name="UserName"><br>
<input type="password" name="PassWord" value="password"><br>
<input type="submit" value="Submit" name="SubmitLogin"><br>
</form><br><hr>

<form method="POST" action="news.php">
<input type="text" name="Recover Password!">
<input type="submit" value="Recover Password!" name="RecoverPass"><br>
<a href="/forgotpass.php">Forgot password?</a>

<?php
```

```

$username = "Susp3cT";
$recover = 'RecoverPass';
if (isset($_POST['SubmitLogin'])){
    $username = $_POST['UserName'];
    $password = $_POST['PassWord'];
    echo "You are the best, " . $username || " This is NOT, the right username!";
}else{
    echo "<br>You need to enter something buddy!";
}

if (isset($_POST['Submitlogin'])){
    $recover = $_POST['RecoverPass'];
    echo "You're password is: " . $recover;

}else{
    echo "<br>You did not enter a correct username buddy!<br>" or die;
} if (isset($username ['Susp3cT'])){
    echo "<br><strong>You entered the right username!</strong>" or die;
}else{
    echo "This is not the correct username buddy";
}

?>
</body>
</html>

```

Do not comment on this, if you got some negative to say, about my code, well then you are welcome to FUCK OFF! - I do not tolerate people telling " Hey you did not wrote that code" - Listen, this is my own damn code, so Don't try it skid! ?

badbrains - April 15, 2012, 2:17 pm

It would help if you would tell us WHERE it is saying it. and WHAT it is saying . . .

If you were to have written it, than you would know what the error came from.

You dont know how to program, you just copy and pasted some shit together and it doesn't work.

Than you blandly spout out that you MADE it yourself, and expect us to help you?
Sorry, but if you're a liar from the start I aint gonna support that.

His original thread: <https://hackforums.net/showthread.php?tid=2405924>

emprjoe - April 15, 2012, 2:29 pm

Writing the code that you wrote there isn't much of an accomplishment... It would help if you told us the error...

badbrains - April 15, 2012, 2:37 pm

internet tough guy.

try and hack me, my ip is 127.0.0.1

"say that to my face and not online and see what happens" - you

Susp3cT - April 16, 2012, 12:36 am

Did figure out the flaw my self...

I needed to add a or die;

```
Code if (isset($user['Susp3cT'])) {
```

```
    echo "<br><strong>You entered the right username!</strong> " or die;
```

```
This is solved my problem...
```

japon - April 16, 2012, 1:43 am

```

And the award for the most useless and misunderstood logic goes to.... Susp3cT! Congrats mate, this made me laugh irl ;)

PHP Code

```
<?php
```

```
echo "text output..." or die();
```

Haxalot - April 16, 2012, 1:44 am

@Susp3cT, acting childish and making frivolous remarks is not helping your situation. You are a novice asking for help and you should do so courteously if you would like serious answers.

Lets take your code out of the code tags and highlight it with the following key to see three things:
Things you've done wrong.

Things you can improve on.

Things you've done correctly.

I am only highlighting your PHP code, though for the record your HTML is far from decent. Also ignore the hiphens; they are used to indent your code for better legibility.

```
<?php
```

```

$username = "Susp3cT";
$recover = 'RecoverPass';
if (isset($_POST['SubmitLogin']))
{
-- $username = $_POST['UserName'];
-- $password = $_POST['PassWord'];
-- -echo "You are the best, ".$username || " This is NOT, the right username!";
}
else
{
-- -echo "<br>You need to enter something buddy!";
}

if (isset($_POST['Submitlogin']))
{
-- $recover = $_POST['RecoverPass'];
-- -echo "You're password is: ".$recover;
}
else
{
-- -echo "<br>You did not enter a correct username buddy!<br>" or die;
}

if (isset($username['Susp3cT']))
{
-- -echo "<br><strong>You entered the right username!</strong>" or die;
}
else
{
-- -echo "This is not the correct username buddy";
}

?>

```

Right, now that i have showed you where you have gone wrong and where you need to/should improve upon, lets see how you would correct the above. I'm doing this to benefit your learning instead of me just telling you the answer.

Side Note: That is being lenient with the above highlighting. In reality the above code does not work at all because you haven't added checks, such as seeing if your \$_POST associative array data has values.

Don't worry I fixed it.. .It's working perfectly..

I did remove the RecoverPass, since I did not use it.

This is for testing purposes. Like SQLi, XSS and so on I'm going to develop it furthermore. There

will be functions to enumerate information on how to secure a site against SQLi, XSS, LFI, RFI. Like tab functions ?

[H]ell - April 16, 2012, 4:09 am

Its funny that you've managed to go from 0 to -27 rep in a day, and still think that you're smart. If we look at your code, anyone can tell that its written by someone who just started programming.

[H]ell - April 16, 2012, 4:45 am

First: Your*

Second:

If your knowledge includes coding shit in formats like:

Code echo "You are the best, ".\$username || " This is NOT, the right username!"; That you can better say that you dont have a knowledge at all.

I suppose that you wanted to use a one line if statement.

Than the correct format would be:

Code if(\$_POST['username'] == \$user) ? "You are the best".\$user : "This is NOT, the right username!";

gotshizzurp - April 16, 2012, 4:52 am

(Apr 16, 2012 04:42 AM)Susp3cT Wrote: [\[CITE\]](#) Rep is not my life, you little fag.. It might be you're life. But at least, I get what I need. You guys are just jaloux cause things in life are not going as it should. ?

You might want to take a break behind the PC, and start dating you fag.

I really do not give a damn if people is minus repping me. I am not asking for rep or anything. I got my knowledge, and I'm proud of it. ? ... So GTFO you little skid, which only spend his life on farming rep on a forum.

Imfao, you would of been better off telling us you DID copy and paste that code because it's absolute garbage.

get out of here with your elitist view, your work doesn't match your ego

Than the correct format would be:

Code if(\$_POST['username'] == \$user) ? "You are the best".\$user : "This is NOT, the right username!";

Actually that's not correct either [H]ell.

Use either the ternary operator or the if-statement, not both.

Ternary operator:

PHP Code

```
<?php
echo ($_POST['username'] == $user) ? "You are the best {$user}" :
"This is NOT, the right username!";
```

If-statement:

PHP Code

```
<?php
if ($_POST['username'] == $user) echo "You are the best {$user}";
else echo "This is NOT, the right username!";
```

Susp3cT - April 16, 2012, 3:36 pm

Actually, Susp3cT, AntiPaste is indeed correct.

Sure, your method works although it would be considered (in my opinion) insufficient coding.

You could easily use a ternary operator instead of writing out all that. Ternary is probably easier than an if-statement anyway.

AntiPaste - April 18, 2012, 12:07 am

a) You have an echo between the if-statement and the if-statement's curly brackets.

b) You are missing a semi-colon from that echo.

c) You are not inside a function, return true; does nothing. Nada.

I already posted two ways of doing this that both adhere to coding standards. As I mentioned in another thread of yours, this arrogance and know-it-all attitude of yours is mind-boggling considering your apparent level of knowledge. At least say, "Could it be done like this?" instead of "Wrong, this is how it's done. [insert a completely wrong way of doing it]".

Most developers would prefer the full blown if statement, because over use of ternary operators and the short if statements tend to get annoying if you want to refactor some code.

Also, you make no sense with your statement, "insufficient coding".

No, that "method" does not work, syntax error.

I just noticed the errors in the code, I skimmed it and assumed he would know about those little things.

Also a little hard when he doesn't space it out properly.

(Apr 18, 2012 12:51 AM)Desugrace Wrote: [\[CITE\]](#) Most developers would prefer the full blown if statement, because over use of ternary operators and the short if statements tend to get annoying if you want to refactor some code.

Yes, I know. However for what he's trying to do I would go with a ternary operator.

I guess "insufficient coding" was the wrong word to use, I would just rather go with ternary for that procedure.

gotshizzurp - April 18, 2012, 11:38 pm

What's the difference between ternary operators & full if statements? Does one or the other have better efficiency? Would you be able to notice the difference between the two if there is one?
