Thread: [Armitage : Graphical Cyber Attack Management Tool](#)

jhonmartyn1 - April 20, 2012, 10:59 pm

IF you have any problem related to these content then [CLICK HERE !](#)

Armitage is a graphical cyber attack management tool for Metasploit that visualizes your targets, recommends exploits, and exposes the advanced capabilities of the framework. Armitage aims to make Metasploit usable for security practitioners who understand hacking but don't use Metasploit every day. If you want to learn Metasploit and grow into the advanced features, Armitage can help you.

Armitage organizes Metasploit's capabilities around the hacking process. There are features for discovery, access, post-exploitation, and maneuver.

For discovery, Armitage exposes several of Metasploit's host management features. You can import hosts and launch scans to populate a database of targets. Armitage also visualizes the database of targets—you'll always know which hosts you're working with and where you have sessions.

Armitage assists with remote exploitation—providing features to automatically recommend exploits and even run active checks so you know which exploits will work. If these options fail, you can use the Hail Mary approach and unleash db_autopwn against your target database.

Requirements

To use Armitage, you need the following:

Linux or Windows

Java 1.6+

Metasploit Framework 3.5+

A configured database. Make sure you know the username, password, and host.
