Thread: [\[SOURCE\]auto complete form source example\[SOURCE\]](#)

mem0rex - April 27, 2012, 9:44 am

Well I was bored today so I was messing around in VB .net and make this. Its a very simple example of a auto complete form like Chrome and Firefox has. There are many things you could apply this snippet to.

Screens:

RichTextBox1 = This will hold all your visted links, these will be the suggestions that popup

TextBox1 = This is where you will type part of the site or the beginning of the site to trigger the suggestions.

ComboBox1 = This will be where your suggestions popup.

Drag a textbox, combobox, and richtextbox on to form1.

Then drag the combobox on top of the textbox and right click and go to send to back. Now fill the richtextbox with some URLs for testing. Then type the source!

Source:

Please leave feedback!

why do you need 3 controls to do something that the framework does for you?

this just looks like a waste of time and resources

+Bourbon - April 27, 2012, 11:25 am

That's how you should do it imo.

If

he can even understand this...

" and right and go to send to back."

Pretty good piece of code guy.

Maybe i'll use it in my future project .
