Yes, it's copy the keylogger file to startup folder.

ilias2006 - January 27, 2010, 3:03 pm

well apparently the dude deleted it, and removed server.exe process from his taskbar.... and i receive no logs, anyway i tested on myself i received logs, apparently it doesn't work bro :/ if he delete or kill the server.exe process you won't receive logs, is all the keyloggers same as this? or there is something undetected that u can't see in the taskbar? cuz he told me when he tried to delete file it said it was used by something else so he killed process and he could delete it. Can you fix it asselesion plz? your keylogger is awesome anyway

if he delete the processes you don't get more logs but if you tick the startup option after your restart your computer the server.exe will be in your processes again.. or you can tick the disable taskmanager so he cannot delete the processes

Like i said before, if he delete the server.exe after he open it the server.exe automatic after open copy to startup folder so ..if he deleted the server.exe file and end processes to , after he restart the computer the server.exe will turn on again in process

well i don't know about that but i always name the server like the common used programs like msn(task name-msnmgr) and i use the name msnmrg.exe he won't know the difference and it always works. Very good keylogger.

You're the skid, it has a password protection for a reason. So people can't download it that don't even know how to decrypt a damn password. And you just go ahead and post the password? I'd suggest you remove your post.
