Thread: [\[Script\]List files inside a folder with icons associated to file types](#)

username.txt - May 11, 2012, 4:01 pm

Screenshots:

Description: Display files from a folder with PHP using a recursive function, this means it doesn't matter how complicated your directory tree is, it will always work.

Nice CSS styling and user friendly, collapse/uncollapse folders by clicking on them, or collapse/uncollapse ALL folders using the appropriate button, view file size, choose which directory to list, among other things.

Custom icons for different file types, only included: avi, mov, gif, png, jpg, php, txt, rar. But if you need more just ask, I have pretty much every file type there is, just didn't want to bloat this with loads of images.

RAR size: 68.5Kb
Files included:file_tree.css

file.class.php

file_tree_collapse.js

index.php

Lots of .png icons

Known bugs: none, but it can take a while if you have loads of files, takes 3-4 seconds to display 2000 files.

Hope this is useful for someone, if you develop a system that needs uploaded files to be listed in a nicely styled manner this might be it.

Very, very nice script! It works. It works perfectly with my file library. :) Thanks for sharing!
