Thread: [how to make a php page that edits and clears another PHP file](#)

Crazer - May 12, 2012, 10:53 am

Ok so I would need

/admin/logs.php

to view and be able to edit

../logs/log.php but after lets say the 5th line of code.

I would like to to clear it also and remove ALL text after line 5, But lines 1-5 should not be touched.

also i need

/admin/indexfile.php

to view and edit

../index.php

but the whole file.

Novalty - May 12, 2012, 11:20 am

Give this a go. I've not tested it at all so there a very good chance I've missed something. It's just the first one.

PHP Code

```
<?php
```

```
$separator = '// Edit below //';
```

```
$keep = array(
```

```
    'Line 1',
```

```
    'Line 2',
```

```
    'Line 3',
```

```
    'Line 4',
```

```
    'Line 5',
```

```
    $separator
```

```
);
```

```
if(isset($_POST['submit'])) {
```

```
    $content = implode(PHP_EOL, $keep) . PHP_EOL . $_POST['content'];
```

```
    if(file_put_contents($file, $content)) {
```

```
        echo '<h1>Done</h1>';
```

```
    } else {
```

```
        echo '<h1>Oops</h1>';
```

```
    }
```

```
}
```

```
$file = 'log.php';
```

```
$lines = file($file);
```

```
$current = array();
```

```
$result = array();
```

```
$editable = false;
```

```

for($x = 0; $x < count($lines); $x++) {
    if(strpos(strtolower($lines[$x]), strtolower($separator)) != false) {
        $editable = true;
    }
    if($editable) {
        $current[] = $lines[$x];
    }
}

```

```

echo '<form action="" method="post">';
echo '<textarea name="content">';
foreach($current as $line) {
    echo "{$line}<br />";
}
echo '</textarea>';
echo '<input type="submit" name="submit">';
echo '</form>';

?>

```

Here is my version, you could put it into a function if you want.

```

Code <?php
    $log = fopen("logs/log.php", "r");
    $t = array();
    for($i=0; $i<5; $i++) {
        $t[] =fgets($log);
    }
    fclose($log);

    $log = fopen("logs/log.php", "w");
    foreach($t as $v) {
        fwrite($log, $v);
    }

    //Write your stuff
    fwrite($log, "Test");

    fclose($log);

?>

```

benefit of my code is that it's dynamic.

EDIT: Meh just reread what you wanted. Anyway, you could incorporate mine into his to make his dynamic.

fwrite($log, "Test");

```

```

fclose($log);

```

?>

benefit of my code is that it's dynamic.

Okay man, did not work for one.

1) deleted my first 5 lines of code,

2) as soon as i run code it deletes everything i only want it to delete when i hit delete and display code on load under line 5, and only want to remove underline 5

alphabot - May 12, 2012, 12:01 pm

Here we go, try this: (its based off of mine and his)

Code <?php

```

$log = fopen("logs/log.php", "r");
$t = "";
for($i=0; $i<5; $i++) {
    $t .= fgets($log);
}
fclose($log);

```

```

if(isset($_POST["submit"])) {
    $content = $_POST['content'];
    file_put_contents("logs/log.php", $t . $content);
}

```

```

echo '<form action="index.php" method="post">';
echo '<textarea style="width:50%;height:50%" name="content">';
echo file_get_contents("logs/log.php", NULL, NULL, strlen($t));
echo '</textarea>';
echo '<input type="submit" name="submit">';
echo '</form>';

```

?>

Novalty - May 13, 2012, 7:46 am

Just wondering, did mine work okay? Since I never actually tested it I don't know for sure!

YERANUK - May 13, 2012, 11:26 am

```

$filepath = 'path/to/file'
file_put_contents($filepath, implode(array_slice(file($filepath), 0, 5)));

```
