Thread: [Bypassing Steam Guard on browsers!](#)

Jeez - May 18, 2012, 6:59 am

So here's a small tutorial where I will teach you how to bypass Steam Guard when you log into Steam Community on a web browser. This will only work if you have access to the account owners PC with RAT etc.

I've only tried this with Firefox, but it should work with Chrome and Opera also. For this to work, the victim must have logged in to Steam Community at least once on the browser.

1. Download the browser profile files from the victims browser.

Chrome: User\AppData\Local\Google\Chrome\User Data\Default\

Firefox: User\AppData\Roaming\Mozilla\Firefox\Profiles\xx.default\

2. Download and install the portable version of the browser from <http://portableapps.com/>

3. Paste the victims files into the profile folder of the portable browser.

4. Now you should be able to log in to the Steam Community without Steam Guard pop-ups.

This is of course nothing huge, but has made my day a bit easier sometimes.

Also, I don't know if this has been posted before, but w/e.

Nice find! May use this, its some kind of cache file or cookie. But if it works, who cares.

That's pretty clever actually, I bet it's gonna help plenty of members,
Thanks for the contribution mate.

Why don't you just use your normal browser? You just need to delete your own steam cookies.
