Thread: [HC Downloader-Teaser 1 | FUD CodeDom Downloader Coded from scratch |FREE-Open Sourc](#)

Jacob° - May 31, 2012, 5:39 pm

This is just a preview of the latest (soon to be released) program I've coded.

Its a simple Download and Execute program. This has a few install locations, startup, Persistent startup and delayed execution. The builder requires .NET 4.0 to run and the stub only requires .NET 2.0

This WILL be FUD, but it isn't right now. Still got some work to do for that.

Here is a video

(Note: video is still processing at the time I posted this thread.)

Deceptive - May 31, 2012, 5:46 pm

What is the point of this preview thread ._.? If anything if you're going to sell it put this in Market Place discussions.

Its going to be free. And the point of the preview is just a heads up of what i've been doing.

Looks great! I look forward to seeing the source.

tweety - June 1, 2012, 8:42 am

This is basically a CodeDom builder that downloads a file? Too easy lol. Maybe add some spread functions and so on. Good job for your first program anyway.

I know its easy...didn't I say that in the OP?

It has startup, persistent startup, delayed execution, and 5 different download directories.

I coded the base of this in an hour and did it for practice.

Well try add something that is slightly more challenging? :)

I'm coding an advanced keylogger

<https://hackforums.net/showthread.php?tid=2498366>

Just taking a break.

Just taking a break.

Keylogger isn't hard considering how many sources are released and how many snippets have been posted. What makes you consider it advanced?

Just taking a break.

From what I can see it looks like you designed a GUI with no code. Majority of HF will I agree I think. Anyway, looking forward to seeing how much progress you make. Good luck.

To a user who has not been programming long or someone who has no specialty in a certain aspect of programming, it can be considered advanced to them. We can judge once he releases it.

Opposite of advanced is basic.

Basic keyloggers typically allow only gmail as the smtp server, a log sending interval and MAYBE startup.

Thats because the videos are old (in comparison to the programs functionality now). Now it compiles servers, just have to work out bugs and tweak it some.

(Jun 1, 2012 01:22 PM)TweeTie Wrote: [\[CITE\]](#) Can you show a video of the running programming? I don't mind beta testing it either :D

The keylogger? Yeah, give me a few days. Don't feel like working on it right now.

The Monetizer - July 30, 2012, 4:32 am

so whats the news on this one? forgot about it?

Jacob° - July 30, 2012, 7:53 am

i have lost interest in coding malware.

Snoepie1012 - July 30, 2012, 7:54 am

Looks good, hope you release the source coder later on!
