Thread: [\[Tut\] ?? How to Hit a Target By Symlink?? \[Friendly \]](#)

The Decoder - June 14, 2012, 1:28 am

Yo...> Guyz here is my tutorial to hit a target website on server via symlink
Tools U need:A Nice m Recommding Madspot shell (Auto symlink Feature)
Domain&Users php Sscript
Here is download Link:
<http://tools.parsian-team.org/shells/madspotshell.rar>
<http://pastebin.com/MrWgnXAm>
first We need to Find Ip of our target
Just Open Cmd n type Ping target site url [Like ping google.com]
then u can get ip of site ?
Now go to bing and type ip:(ip address of target) .php?id= or any other dork for sql injection
Like ip:120.124.25.321 .php?id=
try evry site if u r lucky u can find a sql vul. site
if not get any sql vul. site ?
then again type in search ip:(ip address of target) upload file
its allow to find place to upload file in server
Note:if server alrdy have hacked site then u can easily find these by type ip:(ip address) hacked
u will get all hacked site on server n try to again hacked them n upload shell?
After Upload ur madspot shell Click on symlink > symlink whole server ...> Done ?
Now upload domain user script as anyname.php n find username of ur target ?? and symlink that
as ur if ur shell path is
site.com/images/shell.php
then target will b in site.com/images/sym/root/home/user of target/public_html/
find config file login into database and find admin login of target ??
Then FuCkkkkkkkkkkk that Bitch ??
By DecOder/.
any Question then pm me or ask on facebook.com/the.decoder

Th3PonyWizard - June 14, 2012, 4:45 am

Lame tutorial, and that shell is based on /etc/named.conf, which is not that easy to find. You simply told us "Do X, press Y", without any explanation

The Decoder - June 14, 2012, 4:52 am

I also hav anothr way to find user:domain but i think peopls cant understnd dat

hack4all - June 14, 2012, 10:14 am

very helpful tutorial
Thanks for sharing...

BanTeR - June 14, 2012, 10:17 am

Nice guide bro maybe change the font tho to small.

Beladonis - June 25, 2012, 10:44 pm

ThePony is right.. I still don't know what Symlink is. Is this used to shell a website without needs the admin credentials ? How does it works ?

madspot shell have auto symlink option ,so i didnt show wat is symlink ?
well symlink is method to hack other sites on same server

No. Symlink stands for Symbolic Link, which is basically a shortcut function on *Nix systems. Get your facts right.

MosheBenita2 - June 26, 2012, 11:53 am

used to shell a website without needs the admin ?

p.c00d3r - January 19, 2013, 11:02 pm

great. I am going to try. Thank you.

LichKinG - January 20, 2013, 1:32 am

This looks nice let's check it out ?

B1G_BaNaNNa - January 20, 2013, 2:12 am

great guide man haha :D really gonnna help people out

SAMPMan - January 20, 2013, 2:47 am

Not good tutorial, no pictures, not so good grammar..

Why to even bother to make one?

ApolloCreeps - August 12, 2013, 4:16 am

the link is down, please reup madspot.
