Thread: [1-Way Enryptions using a keypool \[Source\]](#)

Invicta - July 3, 2012, 12:54 pm

Thanks to Deceptive for his keypool class, I've made a 1-way encryption tool that utilizes it to generate random encryption keys. NO this is NOT a crypter.

Download: <https://dl.dropbox.com/u/72501937/Keypool%20Usage%20Example.rar>

Hope someone finds it useful. ?

wait,

one way encryption?

does that mean that as soon as you encrypt something there is no way to get it back?

Lol what the fuck would be the point of this? You'd be better off just smashing your keyboard to achieve the same result.

Yep. You'd be better off beating the shit out of your computer.

I was bored so I decided to make something with a key pool.

Storing passwords in plaintext is bad, now you can "one way encrypt" and compare saved to user input.

TL;DR - Hashing

(?°°)?(???? - July 3, 2012, 4:14 pm

It's called hashing.. It's like MD5, a one way "encryption".
