Thread: [\[VB.NET\]\[Beta\]--Qwinja--Encodes/Decodes Messages](#)

xxDJBxx - July 4, 2012, 2:58 pm

Description:

Use this program to transform your Plain English messages into Japanese-Looking Ninja Language, AND decode transformed Messages back into Plain English.

This program will encode 100% correctly, and decode 99% correctly, if you run into a problem, simply submit it.

This program features built-in verification.

Feedback and Error Reporting are built-in, simply open the New Form with the button in the top right of Form1, fill out what you need, and click the Send button.

PLEASE report any decoding errors you run into so I can fix and make this program better.

This is Version 0.5a (0.5.1.115)

Upcoming Features:

Facebook Integration

Double encode method:

English > Qwinja > Binary/Hexadecimal

Feature Suggestions are also considered.

Credit to the Ninjas for the Language, and a Picture site I can't remember for the Status Box pngs

Any and all feedback / opinions are appreciated. I will release the Source a little later.

Fatalz - July 4, 2012, 3:08 pm

quite cool dude but how hard would it be to decrypt the message

doegizfruit - July 4, 2012, 3:09 pm

Hehe downloaded thx

This seems like a unique way to crypt a message.

as the comment above said "how hard would it be to decrypt?"

Switch to the Decode, and paste the Qwinja, Hit submit, enjoy usually dirty/funny message your friend sent you.

i meant without this program how hard would it be

Ingenuity - July 4, 2012, 4:01 pm

Very simple. It's not encryption - it's 'ninja' encoding.

xxDJBxx - July 4, 2012, 4:05 pm

LOL

Spoiler [\(Click to View\)](#)

Error Report: No errors to be reported.

TextBox1: fuck you

TextBox2: ludomime fumodo

TextBox3: fuck you

Without this program, they would need the Ninja Language to decode. They would need to spend hours manually decoding the language. This is also the reason I wanted to have a double encoding method.

You can try to decode that without Qwinja:

chirikiari kiari kato kunakarinnotaku arikutochikutomiku

by the time you DO, the sender has sent at LEAST 20 more messages, if your quick.

With the double encoding they would have to decode the binary/hex, and THEN decode the Qwinja.

^

This.

Ingenuity - July 4, 2012, 4:08 pm

So basically it would stop average HackForums user being able to decrypt or read your messages without this tool. However, if you wanted your messages to be safe from my grandma (my grandma can use google; unlike the average hackforums user), you'd probably need to use something stronger, like AES.

tweety - July 4, 2012, 4:16 pm

Pretty fun. I can imagine having this program in my college class and everyone will start spouting at nonsense and try understand it haha:

"My ass crack hurts"

"rinfu kaariari mishikamime ridoshichiari"

I used this on Facebook with a friend and basically talking shit to people in public. No one knew wth was going on; It was a good night.

But yea if everyone had this tool, there would be almost no point in using it.

arichikitata, kichi kiari ka tokukachi meikafu chimo chimofu meikichiri nokumonotaku

Oppresor - July 6, 2012, 10:43 am

It would be really nice to see the source code to this application.

Mind sharing?

?

When it is worth showing, I will show it. Just need to Add lots of comments, and clean it up, and add one more feature. ?

?
