Thread: [Issue with Encoding PHP shell -> b374k-shell \[Donating \\$5-\\$10\]](#)

rakaka - July 9, 2012, 7:00 am

Hey, I am having issues with encoding b74rk shell <https://code.google.com/p/b374k-shell/>

to prevent scanning, I have changed all HTML to echo out of PHP and escaped if the quotes are in quotes, but I am getting error ->

Parse error: syntax error, unexpected '=' in C:\xampp\htdocs\test.php(2) : eval()'d code on line 56

which is PHP Code

```
<?php
```

```
$pu .= "<a href=?d=".$pz."">".$ps[$i]." ".DIRECTORY_SEPARATOR."</a>";
```

and I noticed something weird, when encoding the php script then printing the source using echo(gzinflate..) instead of eval I could check for stuff that changes, and yes it does happen after encoding which is the following:

Before encoding:

PHP Code

```
<?php
```

```
$res = exe("\\".$fpath."\\" ".$target);
```

After encoding:

PHP Code

```
<?php
```

```
$res = exe('\\\\'.$fpath.'"\' ".$target);
```

If anyone could help kudos to you and I will donate some \$ to your PayPal (\$5-10)

OR!ON - July 9, 2012, 7:45 am

You've got to escape the double quotations.

DeadCode - July 9, 2012, 8:06 am

You simply have to re-escape the quotations

Thanks, fixed now. I got someone else to do it for me, now it works perfect.

They're called special characters...
