Thread: [Still DDoSing on xbl/hostbooting - -](#)

EternityDivinity - July 25, 2012, 7:53 am

I've been out of the game for a good three years now, and this is extremely surprising that all you are still ddosing on xbl. It's just funny how there is no reason too be doing it anymore. I remember when there was only a handful of us who could actually do this type of stuff back in 00. We actually had to sit and learn on our own for years. Now you kids all have the pleasure of buying booter, shells, irc spots, crypters, vpn spots, shit there's even tutorials for about everything now from cryptography to exploitation to spreading to coding an effective bot/virus.. Im pretty sure there's even tutorials on how to commit fraud now.. We had none of that 12 years ago.. Everyone giving away sourcecodes nowadays. The thing with crypters, it just a TEMPORARY fix to your problem. Code a bot/worm/virus from scratch, depending how unique, and the algorithms used, your outcome can be FUD for months. Learn about exploits and how you can use them for your advantage. Without the learning experience, you're staying in the same place you started, and your journey to better yourself seizes to exist...

lol people still hit on halo 3 and its 5 years old

EternityDivinity - July 25, 2012, 8:00 am

That's just sad. Kids these days with their hostbooters and shells they bought...

lulz4days - July 25, 2012, 1:12 pm

I hope that when IPv6 rolls out for Xbox LIVE that the DDoSing stops mostly, but sadly some creative asshole trying to raise sales will implement it, than everyone else will follow.

Amaz0n - July 25, 2012, 1:14 pm

DDoSing is so dumb, lol...
