The Enigma Protector a professional system for licensing and protecting executable files for Windows. The Enigma Protector is an essential tool for every developer of commercial software and shareware for Windows.

The Enigma Protector includes a wide range of unique features aimed at protecting executable files from illegal copying, hacking, modification, and analysis. The supported formats include almost all types of 32- and 64-bit executable files (exe, src, dll, ocx, bpl, etc.) and .NET files created using various development tools, such as MS Visual Studio C#/C++/VB/VB.NET, Borland Delphi/C++, FreePascal, MASM, TASM and others. The protected files can be run on all versions of Windows 95/98/ME/2000/XP/2003/Vista/2008 and Windows 7.

The Enigma Protector will make your software resistant to cracking, and thus will increase your sales. The use of attack-proof cryptoalgorithms for registration key generation will make it impossible for others to reconstruct or reproduce the registration key generator for your software. Various methods of code obfuscation, mutation and virtualization will help protect your application from hacking, modifying, disassembling, illegal retrieval of unique functions and data, etc.

Sorry For VirusScan Friends. I will be very thankfull to you if you please upload and post its virusscan here. i will update it within 24 hours :) cos i have a great connection problem. it took long to upload on jumbfiles only :(

Of course it does, this is the meaning of this program. This protector is reasonably strong, but as any other protection, it could be cracked.

As the topic starter is not answering, here is the mirror: <http://www.sendspace.com/file/8tohvn>

You can check this by yourself, though it is better to run all this kind of software under VM.
