Thread: [Using Gyazo Tutorial - High quality Screenshots.](#)

Hush - September 7, 2012, 6:11 am

Looking around the forums it appears many users don't know how to upload screenshots to Hackforums, instead they leave links. This can be very off putting and doesn't look as professional. I've come up with a 'Short' Guide on how to use the fantastic Gyazo software application, I hope you enjoy it and hope it helps you! Thanks... The guide as follows:

Gyazo is a FREE piece of software that allows you to take a screenshot really really easily! This is useful when making threads which contain images that you need to obtain yourself, such as selling an account.

I use Gyazo all the time, whether it being to show a friend an image, or when i'm showing someone how to do something It's very simple and easy to use, and takes almost no time to install!

(Please skip to "How to Install & use" if you don't want to read the below, and just want to get the install bit!)

Scroll down further if you want to know how to upload images to the forums instead of those pesky links!

—

Why use Gyazo?

- As I've said previously, Gyazo is FREE software
- Quick and easy Installation process
- Easy to use once installed
- Gives URL links to the image you just screen shotted
- MUCH faster than using paint etc. as you don't have to crop!

Will Gyazo harm my computer in any way?

• NO. The answer is as simple as that. Gyazo is a very small piece of software, and has great reviews! Look online if you don't believe me...

Can I use Gyazo on my Mac or Linux computer?

- YES! Gyazo supports: Windows2000, XP, Vista, Windows 7, MAC & Linux!

—

How To Install & Use:

1. First off you will need to go to <http://www.Google.com> and search for 'Gyazo'. It should be the top link, or just go here: <https://gyazo.com/>

2. Picking your OS for installation: You will then see a screen like the one below:

[IMG]<http://img163.imageshack.us/img163/6047/2hq6otj.png>[/IMG]

If you have Windows chose Windows, if you have... Do I need to really say this?

3. Once downloaded you will need to complete the Gyazo setup wizard:

[IMG]<http://img841.imageshack.us/img841/6955/x4mznk.png>[/IMG]

4. Done! You've just installed Gyazo! I recommend pinning Gyazo to your bottom task bar (if you're on Windows) or on your 'Hot bar' on a MAC (I think it's called a hot bar, you know the scrolly bar at the bottom? THAT!) Gyazo will have the little picture that looks like this below:

[IMG]<http://img577.imageshack.us/img577/9977/96gdat.png>[/IMG]

5. Using Gyazo! Let's get onto the part where we actually use the software we've just downloaded... Okay. If you have it in your task bar at the bottom if you're running Windows like in the picture above then simply click on the Gyazo application.

[IMG]<http://img525.imageshack.us/img525/1450/opyxi.png>[/IMG]

You select the area of the screen you want to Screen shot by dragging the mouse, the application will then open up the area of the screen you just screen shotted in a URL in your browser.

6. Simply right click on the image and click "Save as" and then save it to the destination of your choice! It really is as simple as that. You've just accomplished glory. You are the man! (or woman... Awks). But seriously you can now take awesome screenshots without going through the hassle of using paint :)

If you want to Upload your image to the forums then please carry on reading...

To do this you will need to use an Image hosting site. I recommend this site to do this, www.imageshack.us

For this example we're going to use Imageshack. Go to www.imageshack.us and click 'Browse'. Choose your file and then hit upload.

[IMG]<http://img690.imageshack.us/img690/9433/imageshack1o.png>[/IMG]

Once you've clicked upload now you will need to enter some verification text, which is really easy to read and understand so shouldn't take you longer than 10 minutes... just kidding should take you no longer than 10 seconds!

Once you've done that you will be brought to a screen like this:

[IMG]<http://img269.imageshack.us/img269/8631/imageshack2y.png>[/IMG]

You will need to copy and paste the code which says " Forum Code ". With this code copied you then need to go to the forums and paste the code in the white box where you type... just like this:

[IMG]<http://img28.imageshack.us/img28/7788/2dcce3315473f2f95c2db4f.png>[/IMG]

And you're done! Your image will display in your post and you're good to go :)

I really hope this guide helped, Leaving a 'Thank you' below would be nice if you did find it useful!

I know this is probably not in the right section but didn't know where to put it, this is just to help people!

Wigan - September 7, 2012, 6:15 am

Why would you save and re-upload when on gyazo you can right click and "copy image url" lol

The Alex - September 7, 2012, 6:16 am

uhm if you cope image url, you get the same thing as the gyazo link. this is a guide on how to upload images on hackforums.

Wigan - September 7, 2012, 6:19 am

Copy the image url, it's on gyazo's website.

The Alex - September 7, 2012, 7:07 am

Oh apparently it does work.

But isn't your image deleted after so long?

Nedax - September 7, 2012, 7:08 am

We all can do this, don't worry.

But thanks for this nice share sir.

Dr. Michio Kaku™ - September 7, 2012, 7:24 am

You can copy image url then tag it.

And why does someone need tutorial for such easy thing.

Still it's good you gave time.

Yzori - September 7, 2012, 7:31 am

Works flawless, it'll definitely help to get a more professional look to stuff.

thanks, was just a guide to help the people that don't know :)

douchebag - September 7, 2012, 8:03 am

I've always liked screensnpr, no ads or anything, and the networks are fast but I use my own domain with FTP settings, so it's like

www.domain.com/img/1234.jpg

or like www.img.domain.com/1234.jpg

It's neat.
