Thread: [Access to 100 computers; What to do?](#)

Investigator' - September 7, 2012, 11:35 am

Hello dear HackForums members!

Recently I got full(!) access of 100 computers with Windows XP/7 OS(s) on them. They're connected in the same network to the same server. Server is a very expensive high technology firewall protected stuff. Internet speed is about 20 mb/s, but maybe It'll be changed to a 40mb/s one. The computers have got the same external IP.

What can I do with these network of computers without harming or overstress the computers and/or the server itself? Mainly I'm interested in moniteizing.

dagro1994 - September 7, 2012, 1:50 pm

bitcoin mining run a miner at like 50% capacity it will pay for the some of the bills on the power

Hello Sir,

100 computers is not high amount.
Actually its very low amount to do anything for better earnings.
You will need more then 10k pcs to make real money.

Hello Sir,

100 computers you can make a fortune. Please re think before you speak. And no you do not need 10k pc. You can make about \$1-3k per infected user

Impuhsive - September 7, 2012, 3:31 pm

Its a high amount considering that they are all on the same network, running high end computers with great connection speeds.

He's right...and I'm pretty sure you can't make \$1,000 to \$3,000 per infected user.

unbanable_BowseR - September 7, 2012, 3:36 pm

yeah if you would ddos with that it would be amazing probably

James Kirk - September 7, 2012, 4:20 pm

Ignore all above responses. Install a USB spreading bot on all computers. You will have an automatic bot farm, all users of the pc that use flash drives have a chance of getting infected. Say 5 users a week get your bot on their flashes, that will mean 5 more bots a week, and more if you incorporate the fact they may be using other computers with said flash drive.

Many Names - September 7, 2012, 4:27 pm

I bet he's infected his school network like a boss.

I was thinking that but he stated in the OP;

Quote:Server is a very expensive high technology firewall protected stuff

1 creditcard = 1000-3000

Paypal is also sold for a price and you can steal the money as well Lol you've seen too many movies or something, what are the chances of every user having a PayPal with that much? Also I wouldn't take this risk of doing all 100 users. Or not even 100 once they report 3 or 4 PayPal's have been hacked I'm sure they will investigate.

Hmmm, this sounds like delicious. I'll look after BitCoin mining. Thank you for tip!

Of course, you can do more money with more computers, I'm just trying to figure out what can I do with 100 computers, since I haven't got plus some thusand(s) computers in my bag.

...with DDoS you can't make much money, except if I make a booter, but I don't want to host such things from there.

In my country PayPal isn't so popular and people don't keep creditcard informations on those computers. They're "work" computers, not personal PCs.

This seems like legit. I'll surely think about it. Thank you!

Yes, It would be good to not fuck up the server, because I've no money to repair it xD.

I actually never seen a movie about hacking but the paypal is just a extra side money. If you target users who uses e-bay, then yes they would. There are also many more such as identity fraud, bank fraud, ect. If you sell each, its about \$1000 +. socks5, ssh tunnel with a quad virtual private network would help and using neighbours WiFi. They investigate when 1 has been stolen, a call will be made to the user asking permission to start an investigation.

@op

Then blackmail them. An example is make a threat to them to pay around \$20000-80000 for full immunity.

Velomatic - September 8, 2012, 8:22 am

If they are good computers, I guess you could run a miner.

4ndr3wz - September 8, 2012, 9:08 am

Would you mind posting the specs of the boxes? (OS architecture, GPU, and RAM preferably)

r3s3t - September 8, 2012, 9:45 am

DDOS is kinda an invalid point since they are all on the same bandwidth anyways. You could accomplish the same thing with just one computer on that network, and that's what it would look like anyways on the receiving end anyways since they're NAT'd.

Also, do you have an example of a good USB spreader ? I haven't seen one work correctly in over a year... autorun is disabled by default on most comps now also... is there another technique ??

Install SETI ;p

Lol I really hope you're joking. First off talking about CC fraud is disallowed. And secondly CC's are plentiful and go for about 1-3 dollars not thousands not hundreds regular dollars. Because only an idiot would attempt what you're saying

Install SETI ;p.LNK USB spreading has been successful for me in the past. Create a folder called "Recycler" in the root of the drive, and copy the bot into the folder.

Set all of the folders at the root of the drive as hidden folders, and create a LNK file for each of the hidden folders names. Configure the "target"

property of the LNK file to execute the bot (hidden in the "RECYCLER" folder) and open its corresponding hidden folder. For example, "folder1.lnk" would run the bot and open a folder named "folder1". This is the same method that ngrBot used.
