Thread: [Edit to \[code\] \[/code\]](#)

?TN© - September 22, 2012, 12:08 pm

Well its just a simple modification. A select all little button by whatever thats called /. I dont know about you but its pretty annoying trying to select all text in a code box especially if there is a lot to copy.

Something along the lines of this

eg trying selecting all of this text...or maybe its just me.

Code The modern Olympic Games (French: les Jeux olympiques, JO[1]) are a major international event featuring summer and winter sports in which thousands of athletes participate in a variety of competitions. The Olympic Games are considered to be the world's foremost sports competition with more than 200 nations participating.[2] The Games are currently held biennially, with Summer and Winter Olympic Games alternating, meaning they each occur every four years. Their creation was inspired by the ancient Olympic Games, which were held in Olympia, Greece, from the 8th century BC to the 4th century AD. Baron Pierre de Coubertin founded the International Olympic Committee (IOC) in 1894. The IOC has since become the governing body of the Olympic Movement, with the Olympic Charter defining its structure and authority.

The evolution of the Olympic Movement during the 20th and 21st centuries has resulted in several changes to the Olympic Games. Some of these adjustments include the creation of the Winter Games for ice and winter sports, the Paralympic Games for athletes with a disability, and the Youth Olympic Games for teenage athletes. The IOC has had to adapt to the varying economic, political, and technological realities of the 20th century. As a result, the Olympics shifted away from pure amateurism, as envisioned by Coubertin, to allow participation of professional athletes. The growing importance of the mass media created the issue of corporate sponsorship and commercialization of the Games. World wars led to the cancellation of the 1916, 1940, and 1944 Games. Large boycotts during the Cold War limited participation in the 1980 and 1984 Games.

The Olympic Movement consists of international sports federations (IFs), National Olympic Committees (NOCs), and organizing committees for each specific Olympic Games. As the decision-making body, the IOC is responsible for choosing the host city for each Olympic Games. The host city is responsible for organizing and funding a celebration of the Games consistent with the Olympic Charter. The Olympic program, consisting of the sports to be contested at the Games, is also determined by the IOC. The celebration of the Games encompass many rituals and symbols, such as the Olympic flag and torch, as well as the opening and closing ceremonies. Over 13,000 athletes compete at the Summer and Winter Olympics in 33 different sports and nearly 400 events. The first, second, and third place finishers in each event receive Olympic medals: gold, silver, and bronze, respectively.

The Games have grown in scale to the point that nearly every nation is represented. Such growth has created numerous challenges, including boycotts, doping, bribery, and terrorism. Every two years, the Olympics and its media exposure provide unknown athletes with the chance to attain national, and sometimes international fame. The Games also constitute a major opportunity for the host city and country to showcase themselves to the world.

Cryptic™ - September 22, 2012, 12:10 pm

I agree there should be a select all button. Great Suggestion. A little Java Script should do the trick.

Retribute - September 22, 2012, 12:12 pm

I love the idea. I'm usually on the iPhone, and it's a pain in the ass, or even not possible, to select the entire quoted or coded text to copy and paste.

?TN© - September 22, 2012, 12:20 pm

Thanks i am always on my phone and trying to select the coded text is near impossible. Also when i press ctrl a it selects the whole page not just the coded text maybe that could also be fixed. Something like pastebins raw data

Positive - September 22, 2012, 12:31 pm

I support this actually. Have had some trouble in the past. ?

_DeNy - September 22, 2012, 3:44 pm

I'll think of some way to do it with a userscript...

This was suggested and (if I remember right) denied in the past.

Douchebag # 145 - September 22, 2012, 3:53 pm

I support this completely. It's a hassle sometimes when it's very long, or if you're on a mobile.

tres - September 22, 2012, 3:58 pm

I completely support this, hope it goes through.

?

[img]http://i.minus.com/jbe24akHI32wFI.png[/img]

There you go guys.

Volim te - September 22, 2012, 6:28 pm

Actually this is a pretty good idea, and for [php] as while.

There you go guys.

Damn you. Beat me to it while I wasn't on my laptop.

/dislike :(

Omniscient - September 22, 2012, 6:48 pm

Oh I agree. I've peeked into this a couple times too. Doesn't appear to be an efficient way to accomplish this though.

MyBB 1.6x changed how mycode works and I hate the slider and having code hidden. Definitely makes it annoying to select all too.

I've made suggestion to MyBB to add all default MyCode to the database for easier editing and control. If they listen it will vastly change how most MyBB forums deal with their MyCode. A slew of new more custom codes would occur.

Spent a few minutes now looking again. Same conclusion. Too much of a pain in the ass to edit

core files just to have this simple feature. Maybe in 1.8x I can do it. Codeblocks aren't under ID's they are under a class which imho is the bad move.

Dan. - September 22, 2012, 9:28 pm

Well that sucks Omni. The userscript does a fine job though.

Well that sucks :/..

I'll stick to the userscripts then.

Yes, you can assign ids to each codeblock on a page but as Omni said that isn't efficient.

BaussHacker - September 23, 2012, 4:47 am

This would be appreciated, especially if you paste your code and figure out there is a mistake and you have to select it all! :D

?TN© - September 23, 2012, 12:09 pm

Thanks guys it just hit me one day lol. I hope it gets implemented

Omni already said it isn't going to be done since it will be too much work.

[img]http://i.minus.com/jbe24akHI32wFI.png[/img]

There you go guys.

Just use my userscript; works flawless too.

Retribute - September 23, 2012, 12:37 pm

(Sep 23, 2012 12:35 PM)xadamxk Wrote: [\[CITE\]](#) Wait.... The people who want this(including myself) are on mobile devices.

Mobile devices have no way of adding these user scripts....

Exactly. That's why I personally don't see much of a point in installing the userscript.

But good job either way.

He didn't deny it; he said it is too much work.

Omniscient - September 23, 2012, 3:23 pm

Quote:Yes, you can assign ids to each codeblock on a page but as Omni said that isn't efficient.

But you can't do it without a plugin or core file edits.
