Thread: [Can you redirect a host to an HTTP connection using etter.conf](#)

Malagant - October 7, 2012, 7:55 pm

Right near where it says "microsoft sucks" I remember typing the address of facebook next to it and that made it where everytime I arp spoofed a computer, it would redirect them to facebook. Is there just a way to redirect them to the site they want to go to but with HTTP instead of HTTPS?

But I think some sites like gmail and paypal force HTTPS.

Terry A. Davis - October 7, 2012, 7:58 pm

Maybe you could try to redirect it to a http version other wise if it's forced no I don't think you can

Malagant - October 7, 2012, 8:06 pm

Hmm. Well - I'm just worried that I'll have to type up every website in HTTP form and put them there as a list in etter.conf

I had a problem though. It would only redirect to the first website I listed even if there was more sites I typed up. It would always redirect to facebook because that was the first one right above microsoft.

I think with sites that are permanently using HTTPS connection. If a network will only allow HTTP, they simply won't connect to the site at all if its not through HTTPS.

Website business is getting smarter.

I might give it a try and see what happens though. It most likely won't work but I don't know any other methods that would accomplish what I'm trying to do.

Are you trying to chain redirect like Yoursite > Google > Facebook > Microsoft I don't think you would be able to control the chain after it left your site
