Thread: [Infect school network to hack slaves](#)

Intellectus - October 13, 2012, 8:03 pm

Is there any possibility i could hack the school network to infect my enemies? I mean, i know how to hack the school network but are a bit skeptic on infecting it in some kind. I want to take down several targets that have been bothering me, so i want to show them the cyberspacewarriorstyle to take them down hardcore, i feel like that hurts more than punching them in the face, or am i wrong?

Anyways, should i do this. And do you think i can do this outside the schools area so i will be able to use a VPN?

Thanks for answers in advance OPs ?

EDIT: Sorry! Posted this in wrong section, can someone please move this thread? ?

umm i probably wouldn't do it via school because they might report you or you might get caught and like go to jail.... soo uhh my suggestion hack a friend of your enemy or a friend of a friend, etc then go on their facebook and convince your enemy to download your RAT and bang do what the fuck you like i suggest you to use njRAT and also Jrat. njRat is a great stable rat which i use as my main Rat. Then once you have that rat installed check to see if they have java then install jrat from your hard drive. jRat is a rat coded in java, but the reason i like it is because it has alot of "fun" features, just go check them out :P

Pretty easy to find btw by using the search tool

So how do you suggest i try to infect them? I mean, we hate eachother so there is no way i can contact them in any way at all. Unless i make an fake Facebook profile and try to add them as a friend ? So what do you think, any thoughts? ?

Deiza - October 13, 2012, 8:19 pm

like i said, this is what i do, i infect some old friend that i don't care about, saying like "can you help test a program we had to make in I.T?" and so then i infect them. then send the virus again to a friend who is on my main targets friend list (using the first person i hacked FB). Then use that friend of a friends (2nd account hacked) account to give it to the main target.

Just make sure you don't make it obvious you sent them a virus, as in don't make it obvious that you sent a virus to one of their friends.

Edit:Reread

You are right, i will try to do that. It will be a long journey though i suppose. Anyways ty OP ?

you'll be surprised won't take too long (if you already have server setup)

Umm if you don't have server setup i would probably say a very max of a week.

Btw if you want you can give them my virus and i can do it for you then by the time you set up your own server i will have infected your "targets" and then i can just install your virus secretly.
