Thread: [\[RELEASE\] Skype Resolver <Retrieve from API Script> \[RELEASE\]](#)

Ashes - October 13, 2012, 9:37 pm

I just took this off my boot.php and decided to give it out because it's simple but effective, so enjoy. Simply once you've inputted the skype you want to resolve, after editing the code with your API, once you hit the resolve button it echo's the IP retrieved from your API.

PHP Code

```
<?php
```

```
if(!empty($_REQUEST['resolveBtn']) && $_REQUEST['resolveBtn'] == 'Resolve'){
    $skypeName = trim($_REQUEST['skype']);

    if(!empty($skypeName)){
        // Connect to API an get Skype info.
        // I'm not sure what this code would look like, it depends on the API
        // For example
        $skypeInfo = file_get_contents('http://Skyperesolver/resolver.php?key=YOURKEY&name=' .
        $skypeName);
    }
}

if(!isset($skypeInfo)){
    $skypeInfo = "";
}
```

?>PHP Code

```
<?php
<input name="skype" value="<?php echo $skypeInfo;?>" type="text" class="input-large" id=
"input01">
```

Looking good. You've done well to contribute so much since arriving at our forums. Looking forward to seeing more.

Good release.

I've seen quite a few though lately, especially regarding APIs.
