Thread: [CodeSafe - Save those important codes](#)

System[X] - October 20, 2012, 5:33 am

I have made a basic app to store codes in, like a code bank.

All coders from beginners to pros always need some sort of reference to codes while there coding wether its there own projects, forums or google. From time to time we need to look up code that we have already codes just for a reference or to refresh our memory.

CodeSafe will store and save these code snippets for you for future reference because after all we are all human and forget things.

I always for get regex and regex pattens so i store them in Code Safe and if i ever need reference to them i can easily take a look and refresh my memory.

You can also use this to save any information, not just codes but anything, links, text, letters, memos, anything :)

Please say thanks :)

Thanks

Corneliuss - October 20, 2012, 5:41 am

Thats really cool.

You should add a feature so you can share the snippet with the world.

DotNetNut - October 20, 2012, 6:40 am

Is this text based or MYSQL?

If text based is not that cool and will mean you have to have a separate place holder for the code not accessible to you whilst elsewhere (on another pc).

If it is mysql then Gratz to your sir will be using it...

System[X] - October 20, 2012, 6:43 am

If it is mysql then Gratz to your sir will be using it...

The codes are not saved in a mysql database and yes, if you take this with you on another machine then there will be no notes.

Thanks

Fat Tony - October 20, 2012, 6:58 am

Very useful will be using for share thanks for the share xD

Secret Agent - October 20, 2012, 7:40 am

Is the data stored in My.Settings or as text file? If it's a txt file where is it located?

DotNetNut - October 20, 2012, 8:10 am

(Oct 20, 2012 06:43 AM)System[X] Wrote: [\[CITE\]](#) The codes are not saved in a mysql database and yes, if you take this with you on another machine then there will be no notes.

Thanks

Yea i made a few like that but got flamed so hard from the community for a simple (text) saver, Mine even had encryption's for safer storage etc..

It had search , encryptions etc. but i still got flammed... so good luck.. :P

prodigyhf - October 20, 2012, 8:12 am

Looks really nice man. I may use this in the future.

System[X] - October 20, 2012, 8:46 am

(Oct 20, 2012 07:40 AM)Rice Wrote: [\[CITE\]](#) Is the data stored in My.Settings or as text file? If it's a txt file where is it located?

The data is saved into the registry file, 1 key only

Thanks

I made a notes systems kinda like this and used 2 encryption methods and saved into the registry file. I released it and many people used it and still use it.

Its also depends on the design and idea sometimes more than the actual coding for people to like it, thats why i chooses mav's evolve theme as its amazing and makes an app look supreme.

I don't know any coder that can say they know everything and can remember everything, even i, after several years of coding still need to look back on older projects that i have made for a reference or to refresh my memory on certain codes.

This tool helps in many ways and saves me a lot of time.

Thanks

SIM-111414 - October 20, 2012, 9:23 am

Nice release mate.

I think search would be interesting in case if a user have very much codes.

Or categorised codes will be awesome thing for future upgrades. (e.g. user tags a code as asm, vb or any other and with simple tag we get all the codes associated with that tag).

Anyway very good release.

:)

Keep it up bro..

Thanks for the reply,

Yea i hear you on the having to look back from time to time, we all do i think :D

It dose interest me tho why your saving it to the registry? I thought it would be a bad idea to save so much data to the registry... What would happened if i tried saving a big bit of code? How much storage can the registry hold in one key?

I mean say a user added a password list to it, could be anything up to 2gb for example?

And yea for me it has always been the code, i was never blinded by fancy bells and whistles or nice colored text/lights (but marvas theme is a beast :D) lol, I'm more into the code efficiency and trying to use the best coding practices available.

Which having poke to you on Skype know you also about the code, So always love looking at your projects etc. I'm still loving the Net auth you made too :D

System[X] - October 20, 2012, 3:23 pm

Registry is effiecent and thats what its made for, storing info. Im not sure how much it can save but i did test with a text of around 5k lines and all the info saved fine and since its not acualy a file and just text then the size is very small

Thanks

Birds - October 20, 2012, 3:24 pm

Where does it save the notes too?

Looks good.

Doctor07 - October 20, 2012, 3:26 pm

Not a bad little application to be honest dude!

You should continue the project and create a sharing function.

Where the codes have to be approved by you and are features within another tab and are based on user ratings etc. :}

whyherro - October 20, 2012, 5:20 pm

Seem pretty sweet, it would be a lot better if it was saved on a database, but awesome none the less.

Dark_Noodles - October 20, 2012, 5:22 pm

(Oct 20, 2012 05:41 AM)Cornelilus3 Wrote: [\[CITE\]](#) Thats really cool.

You should add a feature so you can share the snippet with the world.

God no...don't do this. If you didn't know, Leaf didn't go successful.

Birds - October 20, 2012, 5:23 pm

(Oct 20, 2012 05:22 PM)Dark_Noodles Wrote: [\[CITE\]](#) God no...don't do this. If you didn't know, Leaf didn't go successful.

Why was leaf not successful, just because one is not doesn't mean they all aren't.

Dark_Noodles - October 20, 2012, 5:27 pm

(Oct 20, 2012 05:23 PM)Birds Wrote: [\[CITE\]](#) Why was leaf not successful, just because one is not doesn't mean they all aren't.

What would make this a successful snippet sharing program? There's nothing unique, and you would have to spend all those time managing the project. People could put in fake codes that does not work and rip other people off.

EDIT : This project is fine as it is.

Percocet - October 20, 2012, 11:36 pm

I made one of these some time back that encrypts the snippet and saves it to a location of your liking with a custom extension.

Comes in handy for me.

Dowser - October 21, 2012, 12:20 am

Awesome work man really liked it..

Thanks for the sharing

Keep doing thing like this !

Thanks again!

System[X] - October 21, 2012, 12:48 am

Hi, thanks all for the possitive feedback :)

Since a few are asking for a new feature to save in a database and to add options to share your codes snippets publicly i may add that.

I meen i will keep it the way it is but may add another form for this but that depends on how many uses acually use it for it to be successful and Dark_Noodles has a good point of time spent reviewing and accepting codes to make sure there not LQ, make sure they work and not ripped.

If it turned out to be something successful that users use a lot then i could add some staff to accept the codes ect, this would be needed as i don't want the program to be flooded with shit, spam, porn link ect and son on.

Thanks

Incorrect. Microsoft want's people out of the registry. Use XML or my.settings object.

Use XML or my.settings object.

My.Settings is a really bad idea. XML would be better.

PPAP - October 21, 2012, 1:53 am

Right click -> New -> Text Document

Na, jokes! The program is really cool :) I'm using it at the moment to store some snippets. Would be cool with a "online future", like a login to access your files all over the world.

ident - October 21, 2012, 1:55 am

Care to explain that stupid answer? My.settings is a xml-formatted config file that the user does not have to worry about permissions.

I know that. But I always heard that you lost your data in my.settings when you change the location of your program. Correct me if I'm wrong.

System[X] - October 21, 2012, 2:24 am

Ok, since quite a few are asking to save there codes/snippets on a database to use them when and where ever i will add this. I will create a mysql and a couple php files to comunicate with the app and the mysql.

It will stay how it is to save codes locally and an option to add them to the database with a login so only you see your codes or anyone that you give your login too.

Later i may make it to allow you to publish the codes for everyone to see, that depends on how many use this app, im not going to add that feature if only a few users use it. We will see how it goes but for the database save and login will be all done tonight.

Thanks

ident - October 21, 2012, 3:53 am

A program should only live in One location.
