Thread: [how to make a controlled remote desktop program \(something like a RAT's remote desk\)](#)

k@\$f - October 21, 2012, 5:51 am

so im trying to make a program that will allow me silently to control the victims desktop ... Following some tutorials i managed to get it to connect and send me the pictures of the desktop but i want to code it so i will be able to click and type in the victims desktop .. how would i do that ? thank you :)

Yui Asuna - October 21, 2012, 7:50 am

I can't help you :(

But can you send me the tutorials you used for connection & shit ?

Thanks in advance :)

Use my source (SMI send my image) It allows you to send a picture from client to server :)

Get the screen and refresh it on a picturebox

Get the click and get the infos about the click like 1x and 19y then you send it to the client and the client part simulate the click.

Get the coordinates of the client's click and then make the server click in the same position.

PHP Code

```
<?php
```

```
Cursor.Position.X
```

```
Cursor.Position.Y
```

There has recently been a release on this exact thing. I'll try and find a link fast :)

Here you go :)

well i saw that code but i wasn't able to understand much ...

is there anything more simple ?

thank you :)

It can't be easier man, if you can't understand that, then you really should learn socket and mouse hook before.

iVision - October 21, 2012, 1:28 pm

Loop the picture sending thing, then when you click in the picture box on the event calculate the scale between how the picture is shown and the original resolution, then where you click multiply with the scale, send those coordinates to the remote and let it click. For type send the keys when you type.

Easy as pie!
