Madafakar - October 22, 2012, 7:06 am

Hello, i am pretty new and i know very little about this stuff so i would appreciate some help here.
So let me get to the point, i will try to make this simple and explain it the best i can with a few words.
I don't know how this stuff work so...

There is a website (lets call it A) which i have an account there and what it basicaly does is giving me a link to another website (lets call it B) that connects my account with B.

Using that link people can create an account on B and for each account that gets created on B using my link i get some benefits on A.

(One of those things that you invite your friends and for each friend you get some bonuses and stuff)

So I could use that link myself and create an account on B to get some bonuses but only once.

I guess each IP can register only once, but i don't know how it works if websites use IP detect or something else.

This is where i need your help.

If you can explain me how they work or how can i do it myself more than once i would really appreciate it.

You could PM me to assist me personally if you want to.

Thank you for your time, i hope you can help me.

You could use a proxy or a vpn to make another account...

Most proxies are free such as

www.hidemyass.com

They have a VPN (You have to pay) and a proxy :)

Well it dosent seem to be working with a proxy. I also changed my ip but still nothing. Do you know how these websites work? (Maybe cookies or ?) I have no idea how they work.

Thanks.

usually it based on static IP. a legit one from your own ISP..some of the websites really strict handling this case. so they wont accept any IP coming from proxy or vpn

Thanks for the reply.

I did it from my pc once, and from my laptop (on the same network) and it was possible.

One more thing. I was using google chrome from my pc, then i tried once with IE and i could do it once again from IE.

What can you tell about it?

hurmm..if on your 2nd statement,there's a probability they check based on the user agent as well..quite complicated.haha..

did u try to use the same browser,but only after u clean up all your cache and cookies?

if it works,then they just check on the session.

there might have multiple combination for that session such as time+useragent+IP.

its still just a raw thought ?

Thank you for your help. So what i found so far. They give me a couple of different links. I can register once per link, then clear cookies and register for another link. But i guess if i register for all the links i will not be able to do it anymore. There must be a way to make my pc look like random stranger. Its a Greek website (my country) and they accept only greek Ip's so random proxies wont work for me. If i call my ISP and request a new IP or reset? I don't know but is there any way ?

Thank you for your help once again. :)

i dont think your ISP provider will entertain you just for this. ?

haha.no idea.but my friend's using a service from his local ISP where the IP given is in dynamic. so what he do to get a new IP just restart his connection and modem.

that works for him,but not sure with your place.

else,i dont have any idea man. sorry?
