Thread: [Send form using JQuery without a form](#)

zomgwtfbqq - October 22, 2012, 10:24 am

Let's say I have images that have a numeric id, when someone clicks the image I want to POST the id in variable iCFG. I'm forced to make a POST form otherwise I have to change lots of things to the GET method.

I don't want the result to be returned on the same page, but just open the page configuration(same as you would send an HTML form).

I've tried several solutions that didn't work out as I expected eg:

```
Code    $(".selectinterface img").click(function(){
        $.post("configuration.php", { iCFG: $(this).attr('id') } );
    });
```

Any help would be greatly appreciated.

That should work unless you have an error. Did you try debugging it?

Thanks for your reply.

The example sends the post variable, but it doesn't change the browser location to configuration.php and that's the thing I want like I said.

Quote:I don't want the result to be returned on the same page, but just open the page configuration(same as you would send an HTML form).

I think this solves your problem:
