Intro

Today i'll be sharing a NetcatPHP shell.

As you would maybe notice this is only my second post.

PS: I don't take the credits

What does it do

If you know what netcat is, then there is nothing to explain.

For the ones who don't know:

Quote:Netcat is a computer networking service for reading from and writing network connections using TCP or UDP. Netcat is designed to be a dependable "back-end" device that can be used directly or easily driven by other programs and scripts. At the same time, it is a feature-rich network debugging and investigation tool, since it can produce almost any kind of correlation you would need and has a number of built-in capabilities.

Why would i use this?

You could easily hack a VPS or root a server, nothing to tell really :x

- ? Password protected
- ? No 404 login (Feel free to add)
- ? Nice design
- ? Made by a awesome 1337 muslim hacker
- ? Get Commands to Server - Bypass
- ? Source is not encrypted (So you can edit it, and think you're a awesome pr0 scr1pt0r)

End

Please remember that this is my second post, so don't be too harsh on me :3

Post & PM for the source [here](#).

Thank you for sharing, will use this with joy.

By the way, what does this line mean?

Quote:
Never mind, found out that it was some kind of a contact form.. But someone should check the code. :P

I have nothing against the warriors of Allah, but I have something against those who deface the index of random websites to make their voice heard.

I know I deface websites to but I don't deface the index without a reason.
