Thread: [\[SOURCE\] Adf.ly Helper \[RESOLVE IMMEDIATELY ADF.LY LINKS\]](#)

Gr0wlit - December 18, 2012, 12:49 pm

Hi all, today i'm glad to present you my last simple software:

ADF.LY HELPER

[img]<http://i1.minus.com/iHfnNK5GudHLe.png>[/img]

WHAT IS IT?

adf.ly helper is a simple tool that can help you to resolve immediately adf.ly links, by pasting links into the textbox, or just switch to icon tray, which auto-detects adf.ly links copied in your clipboard, and show you a "popup". If you click it, your browser will open itself into the correct link.

VIDEO

Here you can see the video, which can help you to understand how it works (open it fullscreen):

CREDITS

[Mavamaarten~](#) for his nice [Theme](#).

I've done it mainly for learning purposes.

Comments are welcome!

CamdenP - December 18, 2012, 12:55 pm

Wow good job on that works perfectly!

Fox1 - December 18, 2012, 12:56 pm

u should add multi links option and auto open in browser

checking one by one copy paste long story
look k

GrOwlit - December 18, 2012, 12:57 pm

You can do it, this is one of the reasons why i've released the source

ident - December 18, 2012, 12:57 pm

How is using the Httpwebrequest class or multi threading a feature? Surely it's quicker to wait for a few seconds to load the page then open up a third party application, copy and paste etc. Don't see the point.

GrOwlit - December 18, 2012, 1:00 pm

Don't see the point of your reply. You want to load the page, then send a request to another page, retrieve the link and open it into a new page? This should be quicker for you?

ident - December 18, 2012, 1:06 pm

You jump between the Httpwebrequest wrapper and using the class as a stand alone. If you are using the wrapper why are you not using it's built in Async method?

My point is the class or multi threading is not a feature. It's a programming design that should be only implemented to take long tasks of the UI to keep responsive. Does firefox add under it's feature list multi threaded? No because it's not One.

oh. Just added it simply to know what users that download the source can find into the source. well, now i change it to "Things you can find into the source". If this can help you to feel better

EDIT: changed.

ident - December 18, 2012, 1:12 pm

What would make me feel better would be for you know to go and read up on the WebClient's async method and post back updated. Would be nice to see a member taking on advice :)

Actually i've used a request, since webclients doesn't download the source from adf.ly correctly. What's wrong with multithread?

ident - December 18, 2012, 1:21 pm

WebClient is an internal wrapper for the HttpWebRequest Class. They are the same thing only the class allows you finer control. The Built in Async method is on a threaded pool. Read the MSDN documentation as i have suggested.

Xyzo - December 18, 2012, 1:30 pm

very good work, thanks for sharing :)

mullinupp - December 19, 2012, 6:41 am

And once again mr Gr0wlit releases a neat one to us thanks mate ^_^
