Thread: [Darkrp hack and what are the limits with lua hacking?](#)

jgkilian777 - January 9, 2013, 8:15 pm

hey guys im just wondering are there any lua hacks for darkrp? ive been searching for days and havent found any ones other than wallhack speedhack and esp. Surely you can at least see the passcode for keypads?

And my other question is what are the limits with lua hacking? why can we get speed hack but not super jump hack? thanks

01871717 - January 10, 2013, 8:37 am

you can't speedhack with lua scripts.
because jumping height is handled serverside.

You also used to be able to see keypad codes, But it was fixed.

You can actually still grab them by manually looking for the keypad presses. My script works (mostly) fine.

Chocola - January 10, 2013, 4:08 pm

I think in some cheat C0bra made or...something, there was a keypad detector. Might still work, wouldn't know, don't care, however you can simply bypass allowcslua and create a simple speedhack using cvar3

jgkilian777 - January 11, 2013, 2:08 am

are there any aimbots that only enable and disable when you hit a button or shoot, so you can just walk around and only have aimbot when you shoot cause it gets annoying walking with aimbot on -.-

(Jan 11, 2013 05:55 AM)SilverDoom Wrote: [\[CITE\]](#) it is a lua... its the Hyp3 hacks its like faphack, Lua only. Because my hack's module which is coded in C++ has a speedhack.

Chocola - January 12, 2013, 9:30 pm

I swear to jesus the next person to ask for a speedhack or something dumb like that, learn basic lua and make it in Cvar3 It's not that hard, you can use Cvar3 to force sv_allowcslua and host_timescale.
