Thread: [\[READ ME FIRST!!!\]Newbie/Beginner or New to Hacking?Read Here!!!\[READ ME FIRST!!!\]](#)

lorens13 - March 18, 2010, 1:43 am

This thread is for the members who are new to hacking and want to learn how to hack.

First of all,you should read these threads:

<https://hackforums.net/showthread.php?tid=31205>

<https://hackforums.net/showthread.php?tid=26425>

<https://hackforums.net/showthread.php?tid=28680>

OK,we should start

These are the ways of hacking:

1.Phishing

-This is a fake web page which have a login form,you will send the fake link to the victim and when they are contented,they will write their login details and their login details will be sent to you via web hosting service with PHP enabled.BTW you need to learn some social engineering skills,please visit [this](#) thread first to learn some Social Engineering skills.

NOTE : Phishing is illegal on hackforums and any discussion will warrant you a warning. -Staff

2.Keylogging

-This is a program that will send keystroke via FTP or E-Mail,this is better than phishing because it will not be easily suspected as a fake.

Here are some tutorials on how to use them:

[How To Use A keylogger](#)

[Remote Keylogger](#)

[Ardamax Keylogger](#)

3.Remote Administration Tools or RAT

-This is used to control other PCs remotely,you will send to them the server and when they open it,they will connect to you through client.

Here are some Tutorials:

[Beginner Guide to Remote Administration Tools](#)

[RAT guide Q & A](#)

[Compilation of RATS](#)

[RATS Mega Thread](#)

If you are on a router,you need to portforward your router,visit www.portforward.com and locate your router or click [HERE](#)

4.Stealer

-This is used to steal saved passwords in any browsers,the logs will be sent via FTP or E-Mail.

Here are some Tutorials:

[iStealer 6.0](#)

The other kind of stealing is through usb,you connect the usb in the pc and it will steal and save the saved password in your usb.

Here are some tutorials.

[USB Stealing](#)

Before you send the file to your victim or upload it on a file hosting site,you must crypt your file with a crypter(If your file is detected by AV,you need this),and bind it with a fake or real program to make it more realistic.

Crypters and Binders:

[Binders and Crypters](#)

And also,there are a lot of members offering free FUD crypting service,selling FUD crypter,just search in HackForums

Now that you've learn a bit about this,you should now learn how to spread your virus to get more victims

Spreading Guides/Tips/Methods:

Website Hacking

1.SQL Injection

-This is to bypass admin and gain access on critical data on a website

Here are some Tutorials:

[SQL Injection](#)
[Detailed Basic and Full Injection](#)
[How to do SQL Injection](#)
[SQL Injection\(From Start to Defacement\)](#)

2.Remote File Inclusion or RFI

-a type of vulnerability most often found on websites, it allows an attacker to include a remote file usually through a script on the web server.

Here are some Tutorial/s:

[Basic Remote File Inclusion \(RFI\)](#)

3. Local File Inclusion or LFI

-Can't find a tutorial,try searching in [Google](#) for some tutorials.

4. Cross Site Scripting or XSS

-a type of computer security vulnerability typically found in web applications that enables malicious attackers to inject client-side script into web pages viewed by other users. An exploited cross-site scripting vulnerability can be used by attackers to bypass access controls such as the same origin policy.

Here are some Tutorial/s:

[Hacking With XSS \(Cross Site Scripting\)](#)

5. Telnet (teletype network)

- The term telnet may also refer to the software that implements the client part of the protocol. Telnet client applications are available for virtually all computer platforms. Most network equipment and operating systems with a TCP/IP stack support a Telnet service for remote configuration (including systems based on Windows NT). Because of security issues with Telnet, its use has waned in favor of SSH for remote access.

Telnet is also used as a verb. To telnet means to establish a connection with the Telnet protocol, either with command line client or with a programmatic interface. For example, a common directive might be: "To change your password, telnet to the server, login and run the passwd command." Most often, a user will be telnetting to a Unix-like server system or a network device such as a router and obtain a login prompt to a command line text interface or a character-based full-screen manager.

Here are some Tutorials:

[TELNET](#)

Others:

[Hacking with NMAP and Metasploit](#)

Before you do the hacking,you must first have a proxy or VPN(Virtual Private Network).

What is a VPN?

VPN stands for virtual private network. A VPN keeps your wireless communications safe by creating a secure "tunnel," through which your encrypted data travels. These tunnels cannot be entered by data that is not properly encrypted. Not only is data encrypted when you use a VPN, but the originating and receiving network addresses are also encrypted. This adds an extra layer of security.

What is a proxy?

Proxy sites enable you to bypass your own Internet provider and browse through the proxy web site. All that you have to do is type the web site address you would like to visit in the form they provide, and start browsing. Once you keep browsing using that form, you are protected and your real IP address is not being logged.

Here are some programs:

[VPN and Proxies](#)

Credits goes to the one who created their tutorials and the user included in my thread for their tutorials(to many to mention) and to me for writing this tutorial

Thanks^^

? Elektrisk ? - March 18, 2010, 3:27 am

You're making a tutorial for newbies, yet you don't even know the rules? Phishing is forbidden here. Even suggesting it is forbidden. People who search for it won't find anything, 'cause all the tutorials on it were junked.

Mr Kewl - March 18, 2010, 4:05 am

Phishing

is not allowed any moderator here
close the Thread

Don't tell moderators what to do. If you would read, a mod (kutmustakurt) has already edited the thread.

lorens13 - March 18, 2010, 4:45 am

Oops,my bad,I am really reallysorry...TT

ip Hunter - March 18, 2010, 4:53 am

nice guide tyvm . cheers ?

chroniccommand - March 18, 2010, 6:36 am

This is a "decent" beginner "tutorial", I stress these words. This is not hacking. Keyloggers, RAT's, XSS. These are not hacking. This is simply skid shit. Using a RAT that has already been created does not make you a hacker. It doesnt make you "a ub3r 1337 hacker" because you can go into cybergate, press some buttons and send a server to somebody. I suggest you read my beginners guide. I see here on HF many people with potential skill have been turned into skids because they think keyloggers and RAT's are hacking. Please note I am not flaming, I am simply giving insight to beginners who wish to increase there skills.
