If so, I advice you not doing that because you could get infected easily.

You should either use Darkcomet 5.3.1F and buy a Crypter or buy NetWire and buy xProtect.

aykt - February 8, 2013, 8:40 am

hi, i have some problem about darkcomet.i'll try to explain totally what happened...
i build a server and i think everything is ok but i cant connect my slave.
my port is open i checked it by many ways. (does it have to be 1604 ?)
my no-ip settings are ok.
i used password when building and than i made the password setting on the client.
my slave's os is vista.
my crypter is fileprotector and i made the simplest crypt cause i clicked nothing, just clicked 'crypt'.
i didn't use binder or icon changer.
all i can say is i made the minimalist server not specific settings.
but i don't know why i cant connect my slave.
if anyone has any idea please tell me before i get crazy :)

You will need Darkcomet 5.3.1F RAT, which is the latest version of Darkcomet that can create a server.

Darkcomet Legacy is the latest version that has released, but it isn't a RAT.

If you know what Teamviewer is, it's similar to that.

This guy fixed it, gave me a free crypt and even a test install. Couldn't ask for anything more. Thanks!

Trevor470 - May 19, 2013, 12:07 pm

I could do with some help. I've had multiple errors where people execute my server but do not show up in DarkComet.

For example, I test it on myself, and I show up. I then ask a friend to test it for me, so I know it works for other people. He shows up, but when it actually comes to infecting people, I get 0 installs.

Will PM you my TV details, as I feel iffy about posting them publicly as I wouldn't know if it was you.

TheDarkComet - May 19, 2013, 12:27 pm

I need help with:

1. Portforwarding
2. Binding (Need Help)
3. Spreading (Could you get me a victim, would be much appreciated)
4. Could you help me to change the Icon to?
5. I got Teamviewer
6. I sended a contact request on Skype

Please remember there is a spoofer and a Binder in the Darkcomet 5.3.1 RAT Folder.

Binder/Binding - Binding will combined your server & the file you want binded it with.

Spoofing - Spoofing will hide the extension of your RAT server, it will not change the extension of your RAT server.

Helped me with my RAT. Great communication, thanks for the help

Also sent me 2 test slaves (sadly, they didn't work due to a problem on my side - something is wrong with my RAT)

EDIT: Helped me on TeamViewer. Amazing guy! Fixed it all within minutes! Completely free too.

Big thumbs up to this guy!

IDK if yo can help with this but here goes...

I am thinking of getting started with Netwire. I am keen to get started so I want to buy some bots to get the ball rolling. Now what do I require; installs, loads, installs + updates... I do not understand the difference between them. Then if I do get a load how does the vic execute the RAT to get it running?? I hope my question makes sense, and I hope you can help. Appreciated.
