Thread: [\[TUT\] Using Raptor to make a combo list from single lists](#)

mr.good - February 10, 2013, 12:41 pm

This is a tutorial to show you how to take a single username list and combine it either with that same username list or to take a single username list and combine it with any other single username or single/multiple password list(s) resulting in a user:pass combo format.

Lets say you have a list of single usernames as follows in this example:

```
batman  
robin  
superman
```

And you want to join those in a combo in user:pass format. You can use Raptor to do that. Open Raptor and click on 'file operations' than select the 'combo' tab. Under 'username list' click the folder on the far right and load in your single username list. Than under 'password' click the folder on the far right and load that same single username list. Now check 'simple' under operations and hit 'make combo'. It will pull up a save screen for you to save your new combo. Using the above example will result in the following:

```
batman:batman  
robin:robin  
superman:superman
```

Now lets say you want to take the same example single username list as above but want the combo to use 123456 as the password with all the usernames. You would again open Raptor and select 'file operations' than the 'combo' tab. Under 'username list' click the folder on the far right and load in your single username list. Than under 'password' click the folder on the far right and load a .txt file containing a single password of 123456. Now check 'all possible combinations' under operations and hit 'make combo'. Using the above example will result in the following:

```
batman:123456  
robin:123456  
superman:123456
```

You can also make a combo with multiple passwords attached to a single username list. Lets use the example above and add qwerty with 123456 to the single username list. You would again open Raptor and select 'file operations' than the 'combo' tab. Under 'username list' click the folder on the far right and load in your single username list. Than under 'password' click the folder on the far right and load a .txt file containing qwerty and 123456 as passwords. Now check 'all possible combinations' under operations and hit 'make combo'. Using the above example will result in the following:

```
batman:qwerty  
batman:123456  
robin:qwerty  
robin:123456  
superman:qwerty
```

superman:123456

Thanks for this, always nice to see users contribute to the community!

FroFro - February 10, 2013, 2:01 pm

That's a very nice tutorial and it will become very useful to everybody that is learning how to crack.
Great post OP.

Thanks.

I saw many users asking, so I saw it somewhere and added it.

xavidram - March 15, 2013, 4:51 pm

my only question is how do i go about seperating the combo list to single files for usernames and passwords.

To separate the user and password use the tool AccessDiver

Code <http://accessdiver.en.softonic.com/> ?
