Thread: [Best Way To Protect From DDoS?](#)

iCub™ - February 15, 2013, 11:23 am

Hey guys, I'm not sure if this is in the right section, so I apologize in advanced if it is.

Anyways, I have a question that I'm still searching for an answer to.

Whats the BEST way to counter DDoS attacks or protect against them?

I know a VPN is somewhat good, but I'm not too confident in any VPN to withhold from a 4+gb/s DDoS from some powerful booter.

Anyone with any ideas or sure-fire ways to protect, please share!!

Thanks,
Sully

Contact your ISP on DDos attacks & ask for a new IP..

And instead of using free VPN's, try paying for a very secure one like nVPN...

Try buying DDoS protection if you have the money, or if you know some people, get someone to do it for free for you.

If you have a static ip then you will have to contact your isp to get it changed.

??ep? - August 18, 2013, 3:08 pm

Download comodo firewall, this is the best :3

I Was Getting IP Flooded Just Right Now ... So I Turned on my Zone Alarm Firewall ... ever since then I Haven't got Disconnected you should check it out hope it helps ?

NeverStopTrollin - August 21, 2013, 5:09 am

Contact your ISP tell them you keep getting DDoSed and you want 4 IP Addressees And they will give you 1 so you will have 4 IP's hope this helped

Prevention is better than cure.

Use skype wisely, search for Skype Resolver Preventing tutorials.

Blazin - August 21, 2013, 9:57 pm

The best method not to get d-dossed is never expose your real IP address. That means if you are using skype etc make sure you are on a vpn 24/7. If your server is under attack there is a few things you can do changing the IP for one, setting up multiple ip addresses and when one gets d-dossed have a script add the other ip the network card. Firewalls configured accordingly to help combat ddos.
