Thread: [Crypter corrupts after binding issue](#)

momdari - March 7, 2013, 2:06 pm

Hi, I have a problem binding this program <http://notifier.zicore.de/> to my server. I'm using Fileprotector.

So these are the options I tried to do :

1-Bind The program, then Crypt the server = Server Runs//program doesn't.

2-Bind the Server, then crypt the program = Both run, but the server is unencrypted so it is detected.

3-Bind Crypted server, then crypt the program = Server runs//program doesn't

Keep in mind, there are no options selected on the crypter, and no options selected from Darkcomet.

I need the program to function properly, while the server runs in the background, crypted. The program needs Net framework 4.

Bruce80 - March 7, 2013, 3:47 pm

I would contact the owner of the crypter if you have any problems as they are the best People to talk in regards of things not working.

Good luck

No one is answering me, I need some help with this

GanDino - March 8, 2013, 4:40 pm

try to bind your file with DC, and afterwards crypt all together with FP.
just a suggestion

momdari - March 8, 2013, 5:38 pm

Nice, will try it asap ! thanks for reply

Just tried, It is not working, since the program requires Net framework 4 to function. It Crashes when you run the Stub.

Binding then crypting is not really cool. Since you need startup it will run the bound program on start up as well. You have to bind crypted server, not to crypt file you used to bind.

I'm using [xProtect](#) and everything runs smooth.

momdari - March 9, 2013, 8:36 am

-Even with a Net framework dependent App ?

-Also I'm using Fileprotector and I think there is a flaw in the design of the binder, since binding is a feature pre-crypting, and it does only take effect once you crypt the file and the program together.

FR4M3 - *March 9, 2013, 8:42 am*

ive had this before, i dont remember how i got around it... sucks man i feel you.

momdari - *March 9, 2013, 10:58 am*

Could you possibly try to remember please ?
