Thread: [\[disc\] darkcomet vs. poison ivy](#)

5n4p - March 11, 2013, 4:49 am

I remember the days of using pre-compiled programs - Poison Ivy/Sub 7 and a bunch of other simple and fun trojans/rats.

Nowadays I hear of darkcomet/blackshades - and various others.

Why would you suggest these newer alternatives? To my understanding they all still need to be crypted anyways.

What are your thoughts?

Hidden™ - March 11, 2013, 4:52 am

I do not think that either is worse or better than the other. Each one has it's own unique functions but, each one has a specific job to fulfill.

Rat's would be for total control of a computer.

Keyloggers on the other hand, would be solely for keys.

Stealers, would be just taking data in one big swoop.

5n4p - March 11, 2013, 4:56 am

Right - but I haven't played around with the newer applications floating around.

I am obviously too busy to code my own from the ground up and all the headaches involved.

So I was just curious if there was any new/serious breakthroughs over the years with these newer alternatives.

Everything just seems more mainstream now xD

Terry A. Davis - March 11, 2013, 5:26 am

I'd go for Dark Comet to be honest ?

d0to - March 11, 2013, 5:27 am

DarkComet and BlackShades are still "precompiled". The best free one is DarkComet (not the new legacy one).

Bohemia - March 11, 2013, 6:07 am

I have been using Dark comet for a while and haven't had any problem and also dark comet is good alternative because its servers can be crypted easily while once using poison I had problems crypting it. But my opinion is Dark comet is the best free RAT available!
