Thread: [How to create a form without dependencies.](#)

Cloud_Strife2020 - April 7, 2013, 4:10 am

Hello.

I need to create a simple form with a text on it.

It should run without any dependencies and dlls (without .NET framework and stuff like this).

Which language or development environment I should use?

I already have the Microsoft Visual Studio but it have .Net dependencies.

In web i found some people that suggesr to use Delphi or C++ builder, but I have no idea where to get free tools and how to code in these languages.

Have any idea?

BaussHacker - April 7, 2013, 4:35 am

Learn the languages before jumping into GUI programming.

Cloud_Strife2020 - April 7, 2013, 5:13 am

I know some basics of C#, C, and VB.

And I done some VB gui projects using visual studio, but now I need something that don't have dependencies, so I can't use visual studio, indeed I'm looking for something different.

I need only to do a simple form with a label, nothing else.

BaussHacker - April 7, 2013, 5:19 am

Download this:

<http://d-ide.sourceforge.net/>

Make a Windows Application project.

Change the label.

Done.

Just use Delphi, i'm sure you can find all the resources in the Delphi section.
