Thread: [\[n00b\] mssqlli help \[n00b\]](#)

Solain - April 12, 2013, 4:47 pm

hey hf, I was trying to learn mssqlli for far too long
thought that someone could give me a good guide or teach me
I dont know asp but I know php+sql
(for those of you who are asking: yes, I googld this topic)
thanks for helpers! ?

edit: im 1337 at engliz
Sorry for any mistakes

You could use SQLmap. I have written a nice tutorial. PM me for the link.

-Root - April 12, 2013, 5:07 pm

An important note is that MS SQL is different when it comes to ordered single-cell selection.

Listing Tables: SELECT TABLE_NAME FROM information_schema.COLUMNS WHERE
table_catalog=[database_name] GROUP BY TABLE_NAME ORDER BY TABLE_NAME ASC;

Listing Columns: SELECT column_name FROM information_schema.COLUMNS WHERE
table_catalog=[database_name] AND TABLE_NAME=[table_query] GROUP BY column_name
ORDER BY column_name ASC

<http://www.blackhatlibrary.net> has some great information about SQL injection. They are down at the moment, but

Well that's just rude.

Also, I misread the title.

check the messege I wrote above this one ^^
also for -Root: what is the sigs that makes everything become a comment after it?
cause I know that in php it is --

Not at all, I just appreciate people being polite.

Good luck in your search.

Ah, hackforums has filtered out the forum name.

I guess I shouldn't evade it.

WhiteHattedGuy - April 12, 2013, 6:42 pm

Instructions -

1. Go to website hacking section
2. scroll all the way down until you see the search bar
3. Type into the search bar: SQLi Tutorial
