Thread: [Layered Picture/Icon](#)

Commander 11:11 - April 22, 2013, 6:18 am

So i have been playing with Greenfish Icon Editor Pro!

What i want to create is Layered Icon that appears different at a different resolution!And i have succeeded in that!So now my icon while on desktop look like JPG picture of me and when in folder at view option view as "extra large icon" appears like my picture and on some other view options but on some appears like windows JPG blue icon that we know how it look like!

And that is a great success because that is what i wanted!

Now what is the problem!

When i send it through skype binded with my .exe at my side it appears like i wanted it to appear but when receiver is getting it skype reveals icon from exe. after he has received the icon again appears like i wanted it to appear!

So what is my main question here is WHAT IS RESOLUTION OF ICON WHEN BEING SENT TROUGH SKYPE"??

If i find out that i can make perfect picture/icon,binded that with the real picture and .exe it is imposible to find out what i send consider it that it is good crypted and FUD!

Please help people!

addition: what im creating is dynamic icon that appears as a picture or jpg icon at different resolutions!

just need to know resolution when sending trough skype!

I don't think this is possible. I discovered this and played around with Skype to do this a long time ago and I was unable to get it to work.

I congratulate you on finding the cool trick though :)

Commander 11:11 - April 24, 2013, 6:39 am

Thanks,but will pursue this because i think i could get it to work only if i would know that is resolution of those icons that appear in skype when you send items!

Yeah it's pretty cool you cant EVER tell what you have in front of you until you open properties!But no one would open properties since they wont be suspicious because the picture/icon looks legit.I could post example maybe today so that you can see what i'm talking about! There is no way you could guess that this is what it is! :D
