Thread: [DoS Attacks](#)

**H1TeK** - May 6, 2013, 12:28 pm

I have been looking on Youtube on how to do a DoS attack and so far I only found ones on command prompt. Is there are more efficient way to do a DoS attack on a website?

**Cathal** - May 6, 2013, 12:35 pm

I'm not entirely convinced you understand the term "efficient"..

The GUI makes no difference, so the answer to your question is, no.

**#Skyline** - May 8, 2013, 5:51 am

Go build a botnet son, and then you'll be able to Ddos.

Please do not start a bot net if you are just going to use it for ddosing. It is really expensive and requires a lot more knowledge then you probably have, just go to the server stress testing section on hf and they will have booters and apis for you to buy.

**Anarchy** - May 8, 2013, 6:04 am

DoS attacks will not work unless the server you're using is pretty damn strong and you're stressing a home connection, what you're looking for is a DDoS attack. The difference between them is with a DDoS attack (Distributed Denial of Service attack) you use multiple servers/bots instead of one which would be a DoS attack (Denial of Service attack).

--

To preform a DDoS attack you're either going to need a botnet or a or a booter. For a botnet look up some tutorials and for a booter check out the [Server Stress Testing](#) section and buy one, I'd recommend [xBoot](#).

(May 8, 2013 05:51 AM)#Skyline Wrote: [\[CITE\]](#) Go build a botnet son, and then you'll be able to Ddos.  
This.

Or you could stop leeching off other peoples shit. And learn how to install ssh2 on a server, and compile a setup from a vps, or where ever you like it.

But for a new comer. Your post would be the correct one. Congratulations. ?

Take a look at these.

Layer 4 DDos (Thousand attackers bringing down one machine)

Layer 7 DOS (Where one attacker can bring down one or more sites)

Link-local IPv6 RA Attack (one attacker can bring down a whole network)

Google about and watch a few videos, Theres a brilliant talk at DEFCON on this subject by a guy called Sam Bowne :)

I think that he came here to ask "Is there are more efficient way to do a DoS attack on a website?" it would be my guess that he is not already leeching off anyone. To tell him to buy a vps under his name and use it for one of most annoying things for hosts, other then child porn is a bad idea also. You should learn linux if you want to host anything, ever. It will not only save you money but it is one of the most secure oses that you can find. (and most archs are open source and free!) If you were talking to me about leeching, I do not like booters personally I think they spam HF and are made for dumb people that should not have the power to send attacks. For the second time this week I do not post unless I am accurate and have thought about it, otherwise I might look stupid.

Lol host your own server on linux.

Sounds about right.

**H1TeK** - May 8, 2013, 5:30 pm

Anyone heard of LOIC (Low Orbit Ion Cannon) <http://sourceforge.net/projects/loic/> That is a a tool for (D)DoS and I didn't really know if I could ramp it up

Seriously?

1. LOIC is for skids.
2. It's filled with dead shells
3. It lags your own internet

**Forensick** - May 8, 2013, 6:06 pm

(May 8, 2013 05:55 PM)Allen Walker Wrote: [\[CITE\]](#) this has nothing to do with web hacking why they fuck did u post this shit

one loic is the biggest pro tool for pro hackers 2 it does not lag ur internet it is making ti faster there for loic is not a dos tool it speeds ur computer havji is also a very good tool to

As you can tell he's new to the forums... but to answer your question OP loic is garbage.. and if you just want to hit off your friends and small websites.. just buy a booter for like \$3

**Plista** - May 8, 2013, 11:55 pm

DDoS attacks are also much more effective then DoS. Best not to boot from your own home connection, just lags you. A good booter can be bought for like \$5 a month which hits for up to 30 minutes.

Your pointless act of being a doosh doesn't satisfy me one bit.

He can still have a botnet; just setup a HTTP one, and get a crypter which will cost same price as a stresser. And then he can spread.... DUHH instead of paying monthly for a shit stresser.

It is douche\* . So he will have to buy a host, get a free http bot (Andromeda is the only free one that is worth anything and I just think it is a loader and it does not have any ddos commands). Then try to get a free crypter or one that is really cheap and which the stubs will not last. Then magically spread with out spending any money using some hidden spreading method that you will have to share with him. But he has to get at least 150 bots to take some of the smallest sites down which you are not going to get quality with a free http and most things do not work on it. To set up a net under \$20 would be hard and pointless.

**CoolDude222** - May 9, 2013, 12:18 pm

You can get alot of Doss programs...

Quote:I have been looking on Youtube on how to do a DoS attack and "so far I only found ones on command prompt. Is there are more efficient way to do a DoS attack on a website?"

I don't see why people perform DoS attacks. All it does is piss people off, unless you have a way to make money from it. The only variables that really matter in this case are the number and amount of requests sent. I assume however, that by quality, you mean how easy the GUI is to use.

I'm done fighting over you, and your opinion.

Please take some time to do the math.
