Thread: [Connect to school wifi \(retarded schools\)](#)

OGxKushKing - May 21, 2013, 1:43 pm

This tutorial shows you how to connect your rooted android or computer to schools wifi. (Possibly jailbroken iDevice but i have not tested this)

Alright so my school has wifi that is open but it does not let anyone connect to it. This got me thinking and i realized that the only way this is possible is by registering mac addresses of the school computers and filtering out any non registered ones. So this tutorial is for kids who's school's have mac address filtered networks.

1.) Log onto a school computer and make a batch file with the following code, or use cmd, provided its not disabled.

Code ipconfig /all

2.) Look for the first local area connection. (It should say the schools network domain and is usually the first one that comes up after using the batch script

3.) Write down the physical address (MAC-Address) or email it to yourself

4.) On your rooted android, download busybox and install it, as well as a terminal application

5.) Open the terminal and type in:

Code busybox ifconfig wlan0 hw ether [MAC ADDRESS HERE] where MAC ADDRESS HERE is a school computer's mac address

6.) Then type in:

Code netcfg This will show your network interfaces which will let you confirm your mac address was spoofed.

7.) Connect to the school wifi and enjoy not having to use your data plan?

If you want to do this on your laptop, use backtrack, or a mac address spoofing tool, which there are plenty of tutorials here on this forum.

Note: When you restart your phone, or turn off/restart your wifi, you will need to respoof your mac address. I recommend that you save the terminal scripts in a note so you can just copy and paste it.

--

iPhone (not tested)

add this to cydia

<http://apt.thebigboss.org/repofiles/cydia/>

search MacX4 and install it and use that to change your address,

or

Get Mobile Terminal <http://ZeroBeat.myrepospace.com/>

First gain root access by typing

user "su" then password "alpine"

next type "nvram wifiaddr=xx:xx:xx:xx:xx:xx"  
type any mac address you want  
Restart your iPod/iPad/iPhone for the changes to take effect

Interesting. This seems as a viable solution for that issue. How do you know for certain whether or not the issue is with MAC filtering?

**SIM-1179501** - May 21, 2013, 7:11 pm

My schools wifi asks for a password.  
:/
