Thread: [Re-FUDing a crypter](#)

Bing™ - May 31, 2013, 5:43 am

Hello!

I have a crypter, that currently is 9/37, but I am not sure on how to refud it. If any experienced coder can help me with this please PM me, I am not going to post any part of the code, because I have 0 experience with crypters and I don't know what my shares would worth...

Regards.

Perplexity - May 31, 2013, 5:54 am

Firstly you should learn the language, then you should learn how crypters work. I know you're probably expecting special treatment since you're Ub3r and all but this is the same response I'd give to anyone.

1337r0x - May 31, 2013, 6:11 am

You can't Re-FUD it since you have 0 experience . At least you must know how does crypters in general work , and when you reach the level in which you are able to create your own crypter you will automatically know how to re-FUD it ...

Drug ballad - May 31, 2013, 6:16 am

the easy noob way is to change all the strings thats detected then if you get a detection called genrick (or something, dont remember the exact name) you should switch encryption and many more stuff etcetc

No I'm not expecting to get any special treatment. I was actually willing to reward who helped me, being Ub3r or being L33t is exactly the same, and I have never changed since I registered on the forum.

I can teach you for a price. When it comes to Crypters you shouldn't really ask for anything for free like certain people here.

LethalNET - May 31, 2013, 8:30 am

Huh, if its codedom, you will either need to refud the runpe or the startup

Or stick all in a dll.

OP, I'd go for Tweety. I'm sure he can teach you alot about how things work out ?

I'm beginning to dislike how people tell others to "learn the language". Although it helps to an extent it's not like you can go out to a book store and pick up a book on how to refud a crypter.

What you can do is put the runpe into a dll, base64 that shit then invoke it on runtime.
Also change your storage method, idk if anyone else did this but i used pastebin as my storage method for one of my crypters, i put up my crypted string on pastebin and read it on runtime.

Gotta think of unique stuff :)

Also, try commenting out functions/subs till the detections start going away so you know what part of the crypted file is giving detections.

I also stated he read about how crypters work, it's not hard to find. If you know how crypters work and you also know the language, all that's left is putting the pieces together.

How you guys give suggestion on how to refud this unknown code without even see'ng a scan??
Ther's so much to understand on what is going on if look at the av tags first....every one wants to approach cryptesr and fudding stuff should always keep an eye on what av says..and well know what it means. OP if you post a scan....maybe we have something to duscuss on.
