Thread: [From email pass to email,pass](#)

?Alexander - June 7, 2013, 8:37 am

So I've did manual SQLi on a website and got a lot of emails + passwords in the format of

Code email pass

(e.g. hellothisismymail@hotmail.com andthisismypass)

Anybody knows how I can convert this to a excel file with the format of

Code email,pass

(e.g. hellothisismymail@hotmail.com,andthisismypass)

Help is appreciated.

Cheers!

What is the difference? You could manually do it, If I think of the program i'll let you know.

?Alexander - June 7, 2013, 8:40 am

It makes a different because I'm using a tool that checks if a email and a password matches. Would it work if I use notepad++ and replace ' ' with ','?

EDIT: lol, that actually worked. Sometimes the answer is right infront of you. Sorry, SOLVED!

Vintage????? - June 7, 2013, 8:48 am

I guess so, you could try it, Unless emails contain it, It would work

?Alexander - June 7, 2013, 8:49 am

Worked. This is solved. Thanks!

Or, for the future ;)

Python Code:

```
import string
```

```
a = raw_input("Enter name of the file (has to be in the same or in sub-directory)")
```

```
b = open(a,'r')
```

```
data = ""
```

```
while True:
```

```
    dat = b.readline()
```

```
    if not dat:
```

```
        break
```

```
    data = data + string.replace(dat,' ',';')
```

```
b.close()
```

```
c = open("output.txt",'w')
```

```
c.write(data)
```

```
c.close()
```

^Haven't written any python code for a while, there could be mistakes in it
Edit: Fuck this formatting :(

lol'd

Open it up in your favorite text editor, hit ctrl + h, replace any spaces with commas.
